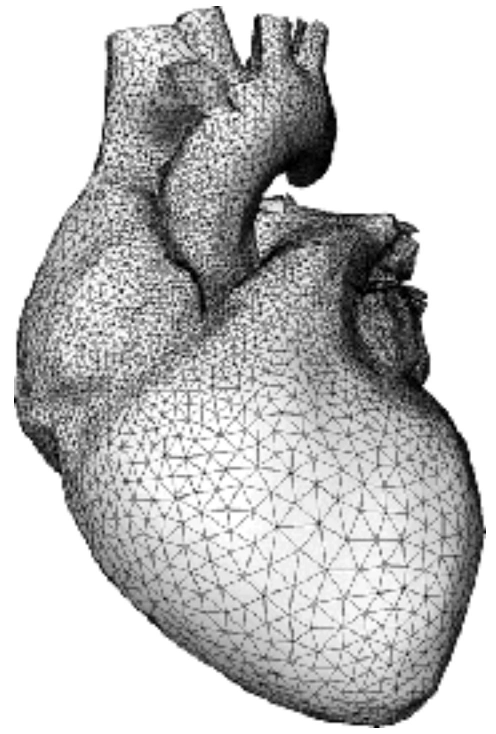
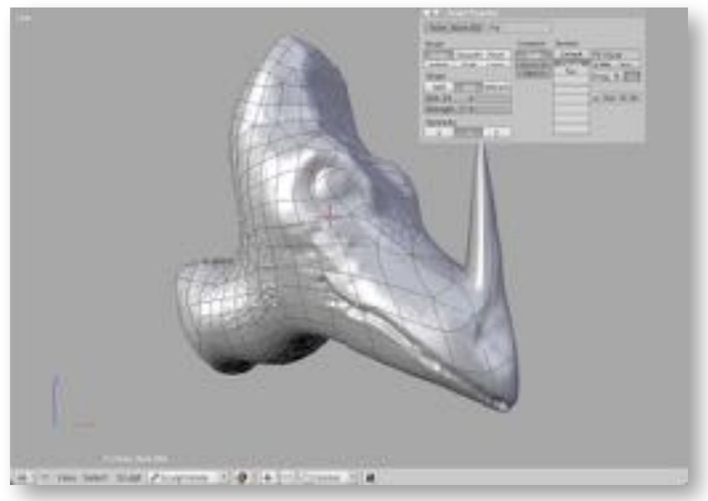
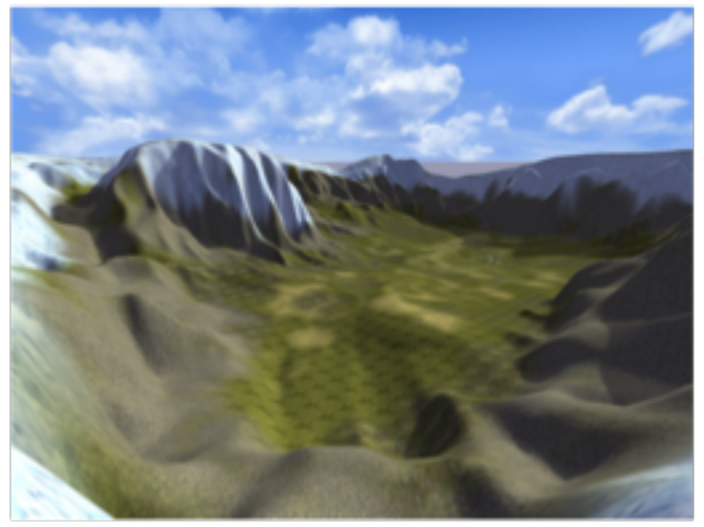
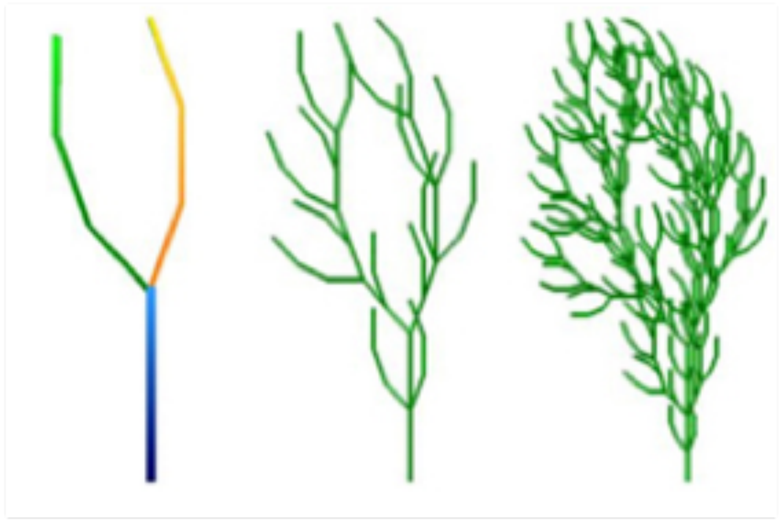
Shape Representation: Origin- and Application-Dependent

- Acquired real-world objects:
  - Discrete sampling
  - Points, meshes
- Modeling "by hand":
  - Higher-level representations, amendable to modification, control
  - Parametric surfaces, subdivision surfaces, implicits
- Procedural modeling
  - Algorithms, grammars









University of Victoria | Computer Science

Similar to the 2D Image Domain

- Acquired digital images:
  - Discrete sampling
  - Pixels on a grid

- Painting "by hand":
  - Strokes + color/shading
  - Vector graphics
  - Controls for editing

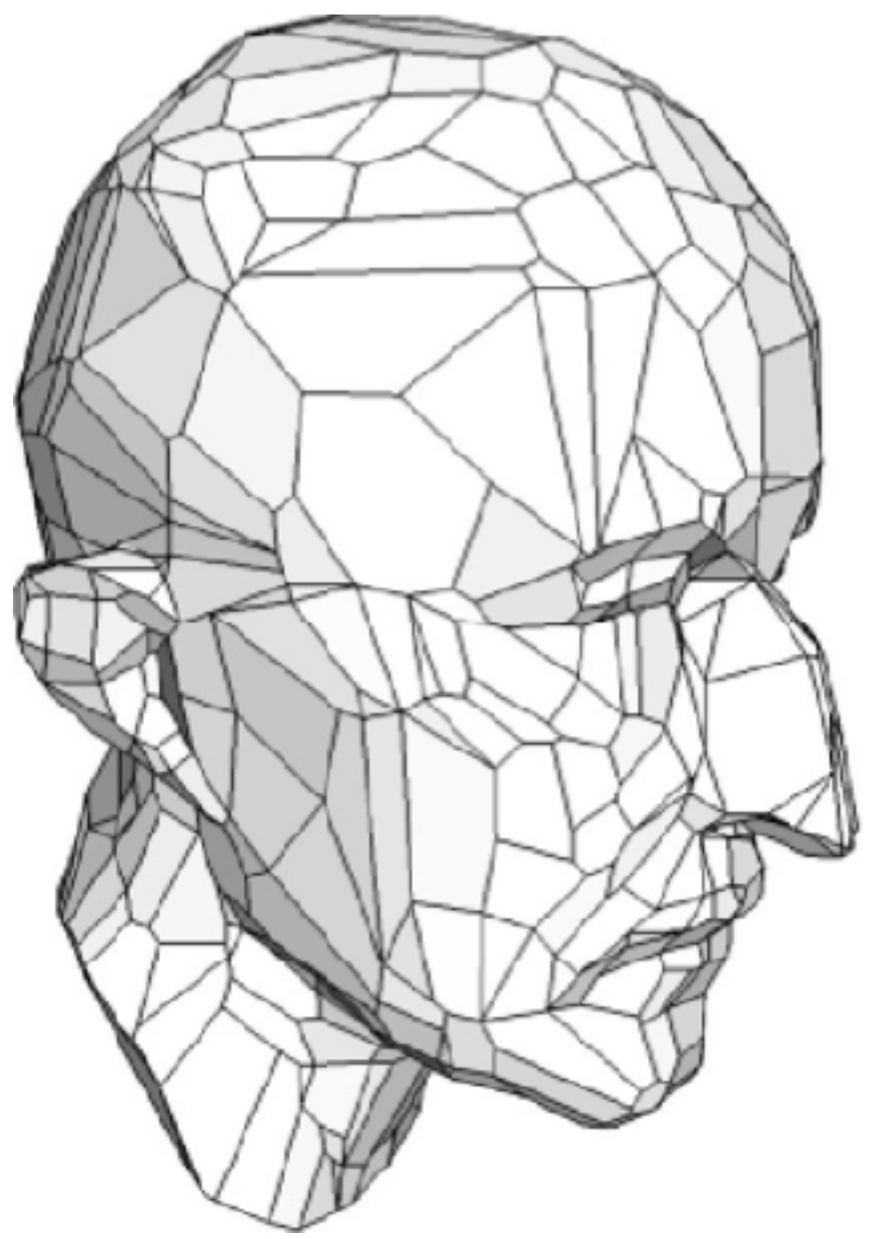
Representation Considerations

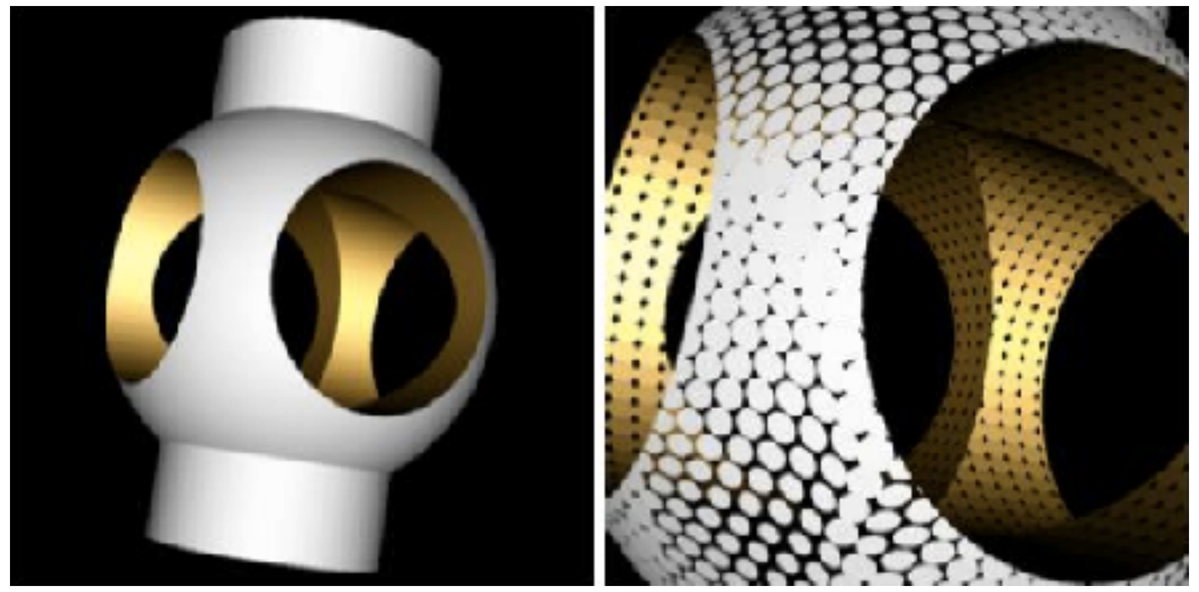
- How should we represent geometry?
  - Needs to be stored in the computer
  - Creation of new shapes
    - Input metaphors, interfaces…
  - What operations do we apply?
    - Editing, simplification, smoothing, filtering, repair…
  - How to render it?
    - Rasterization, raytracing…



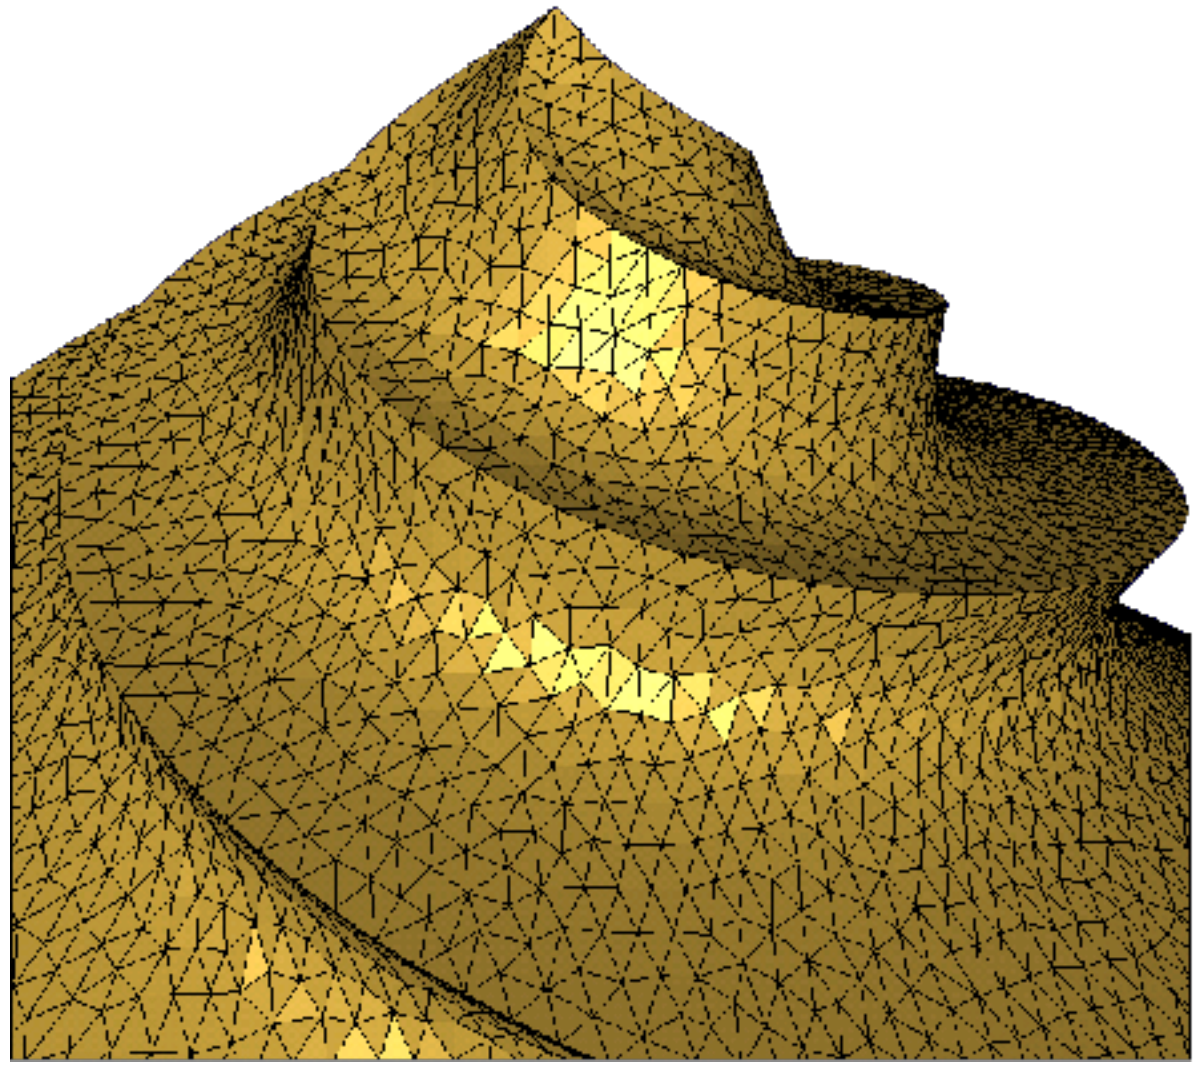
Variational Shape Approximation

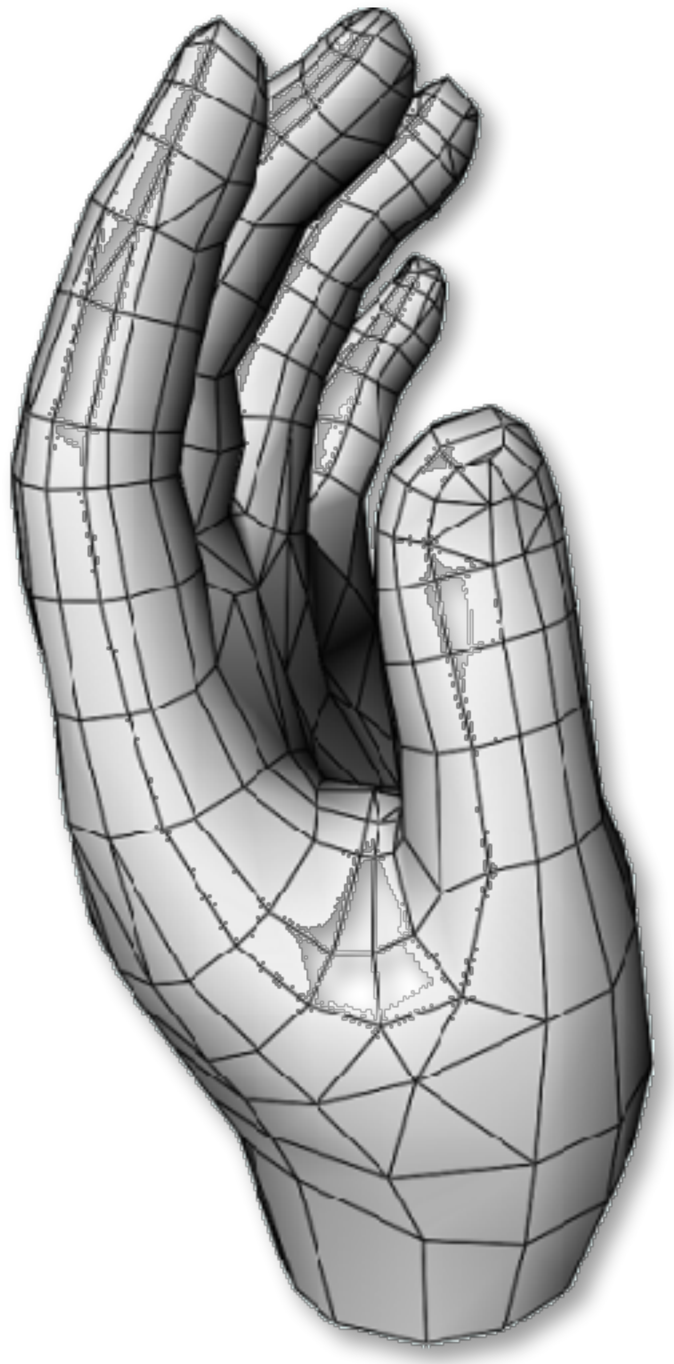
Shape Representations

- Points



- Polygonal meshes

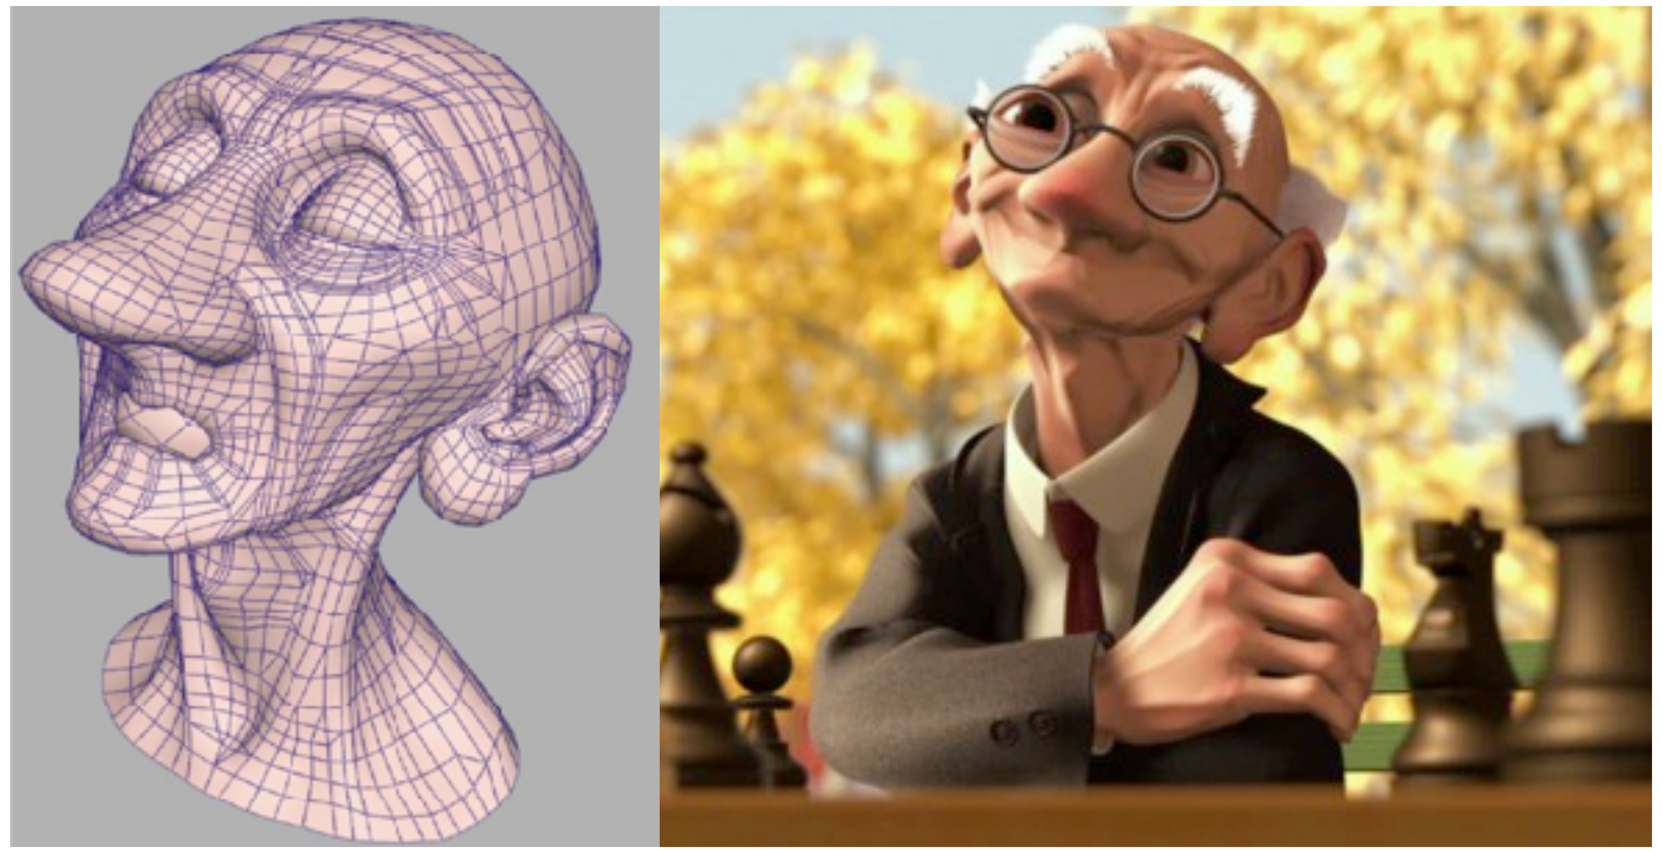




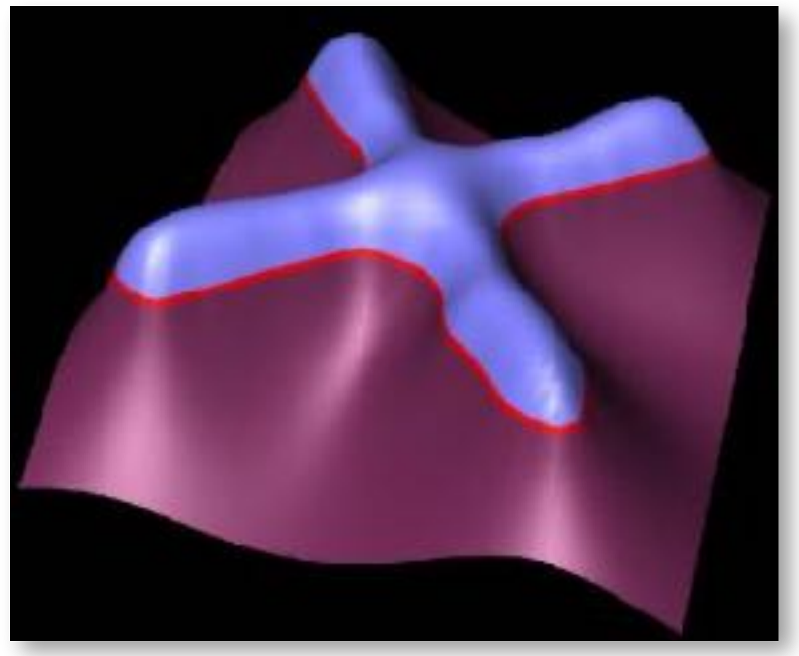
Anisotropic Polygonal Remeshing

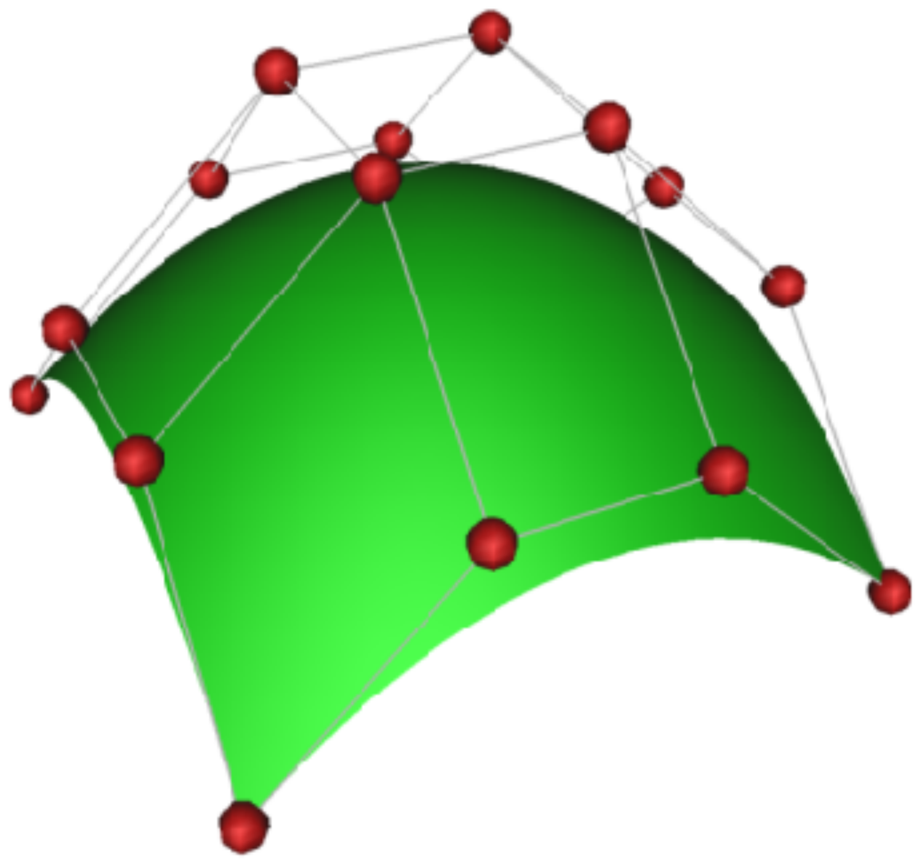
Shape Representations

- Parametric surfaces
- Subdivision surfaces
- Implicit functions



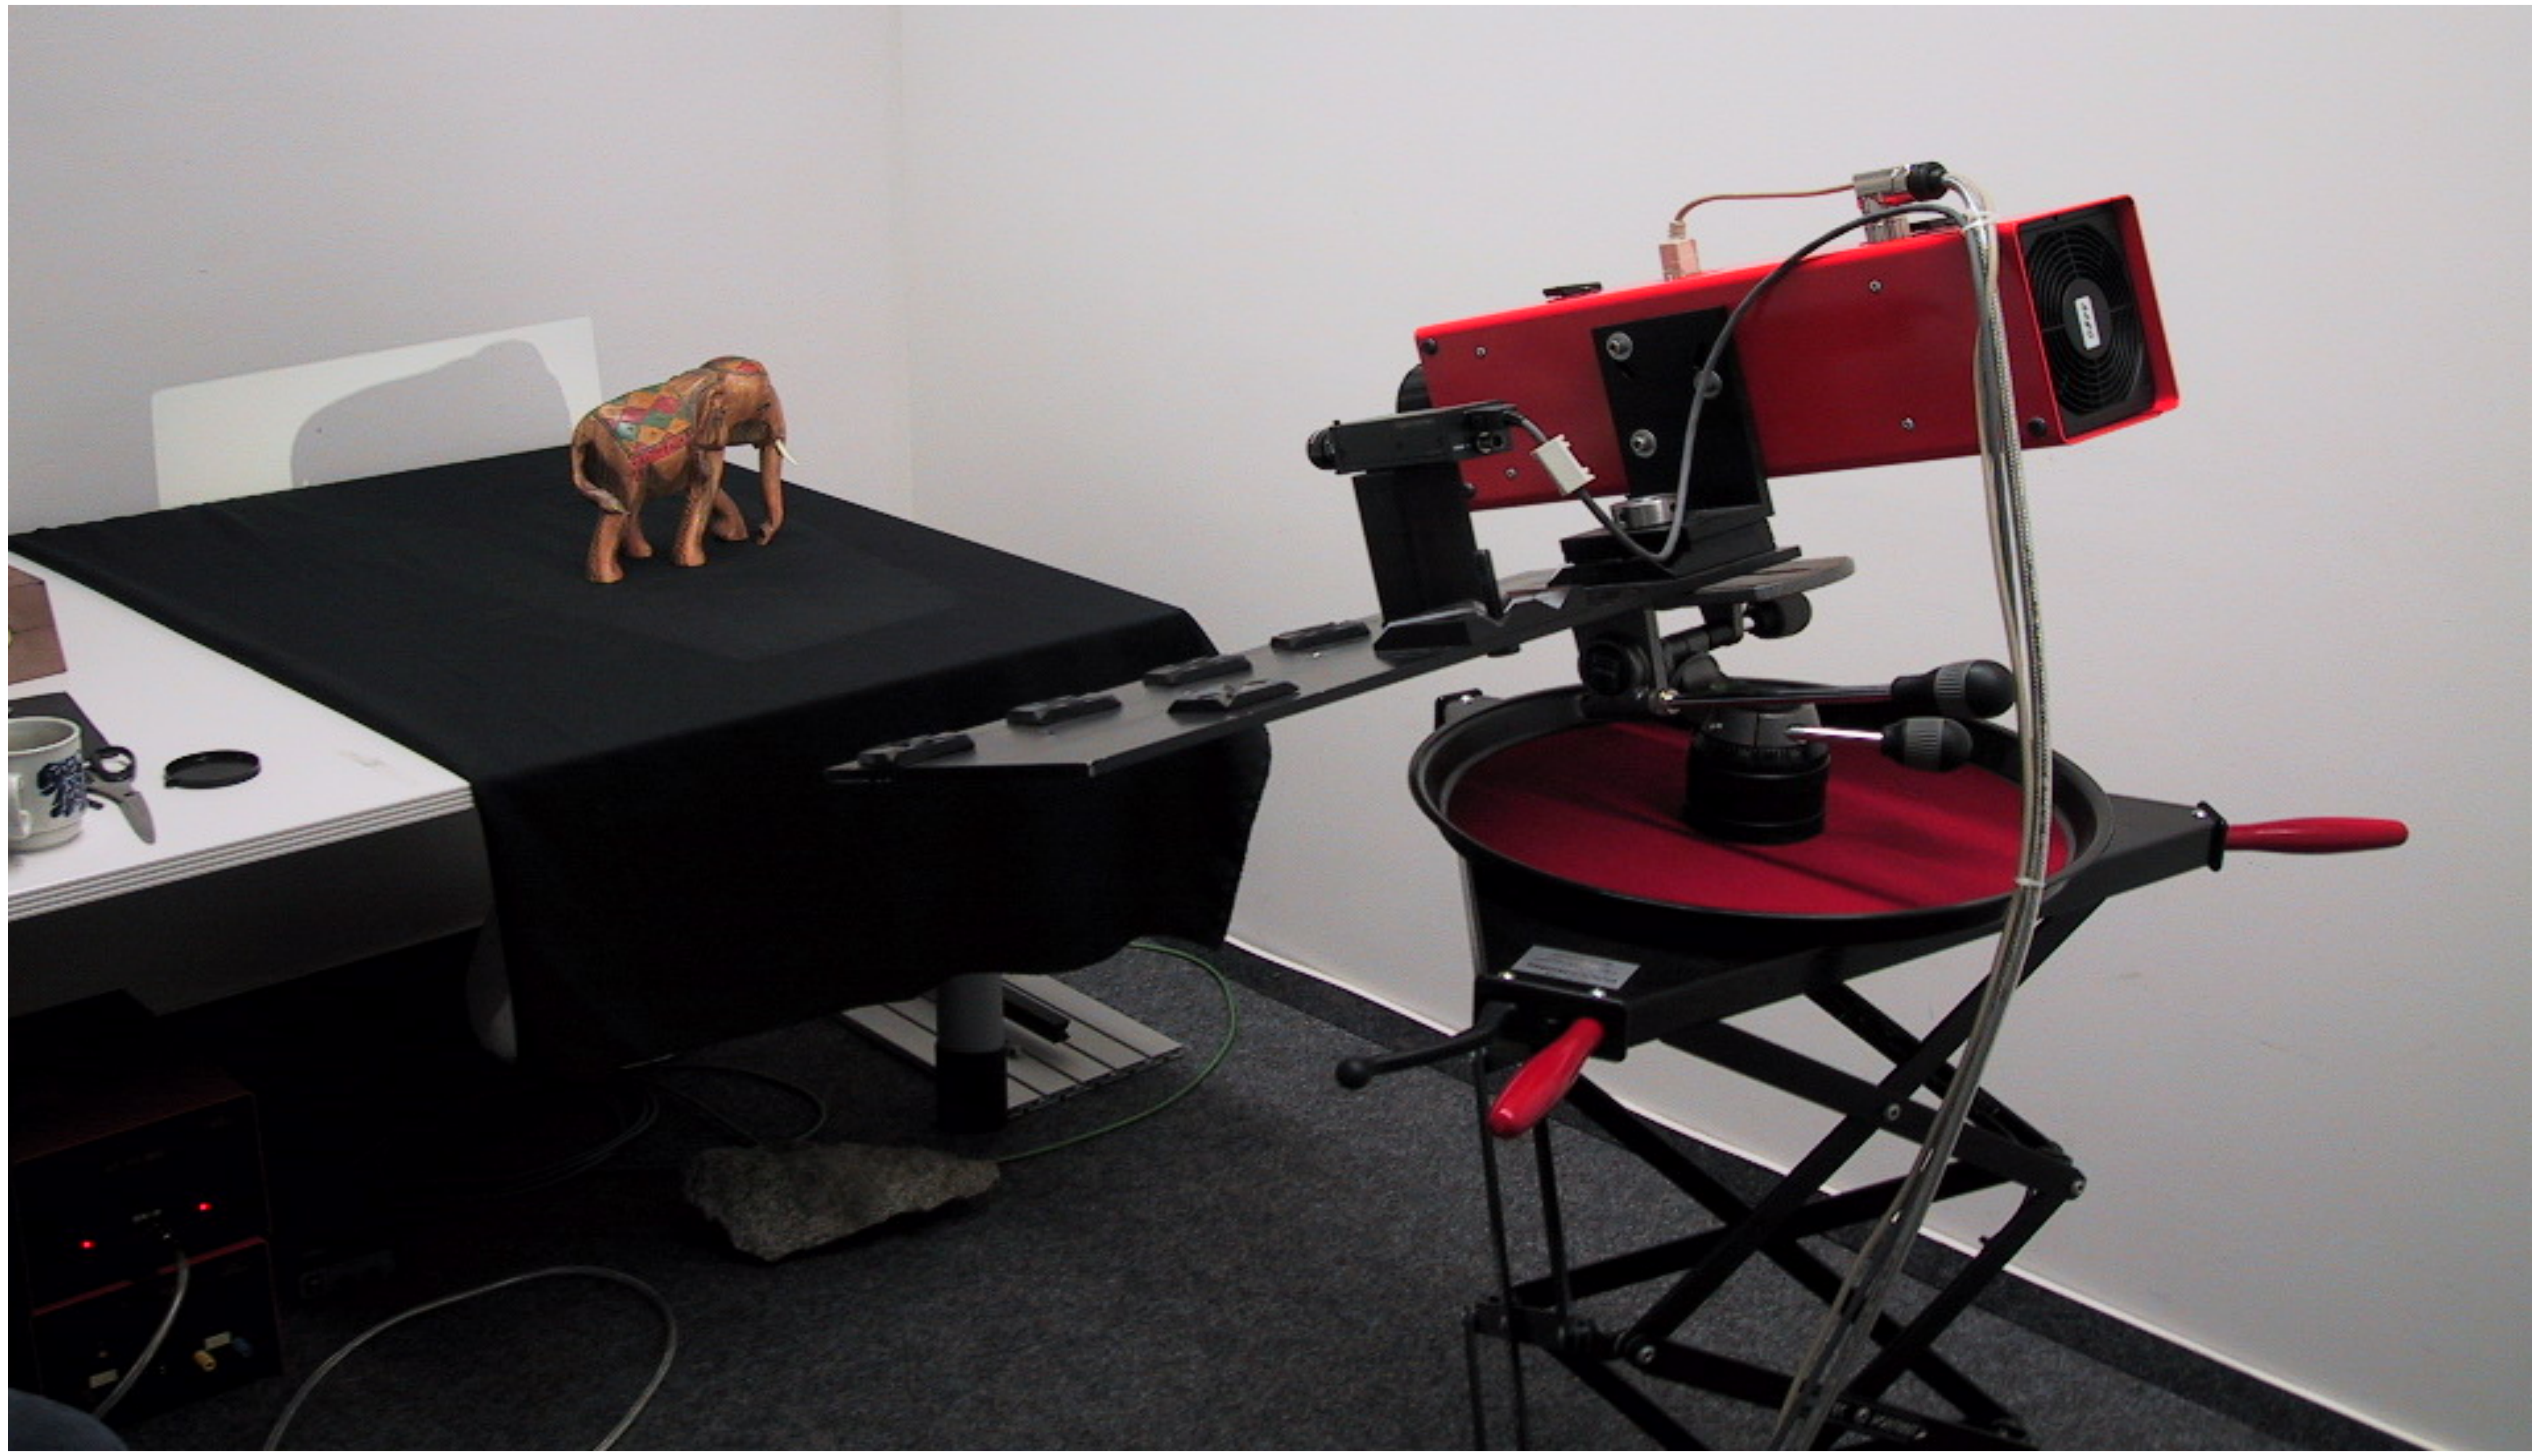
Pixar





Points

Output of Acquisition



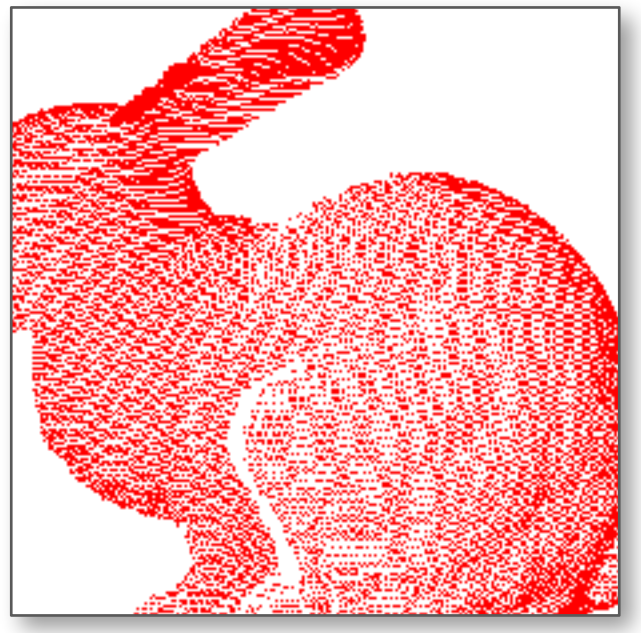
Points

- Standard 3D data from a variety of sources
  - Often results from scanners
  - Potentially noisy

  - Depth imaging
  - Registration of multiple images

Points

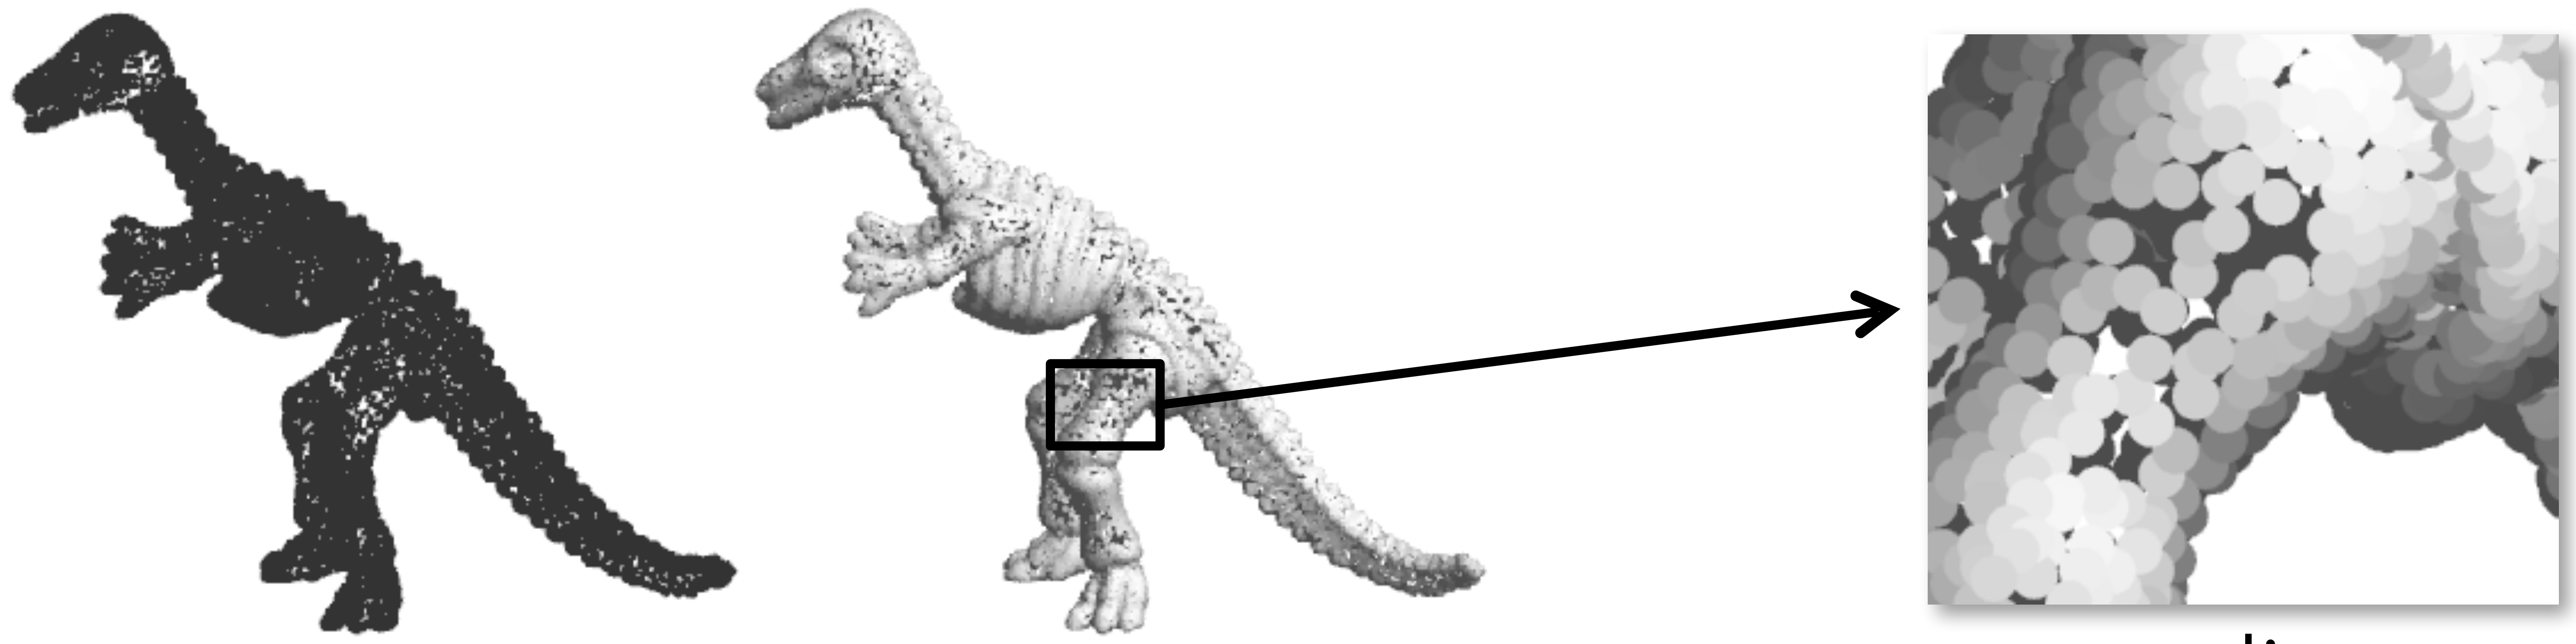
- points = set of 3-tuples (often a collection of grids)



- Often converted to other reps
  - Meshes, implicits, parametric surfaces
  - Easier to process, edit and/or render
- Efficient point processing and modeling requires a spatial partitioning data structure
  - To figure out neighborhoods

Points: Neighborhood Information

- Why do we need neighbors?



need normals (for shading)

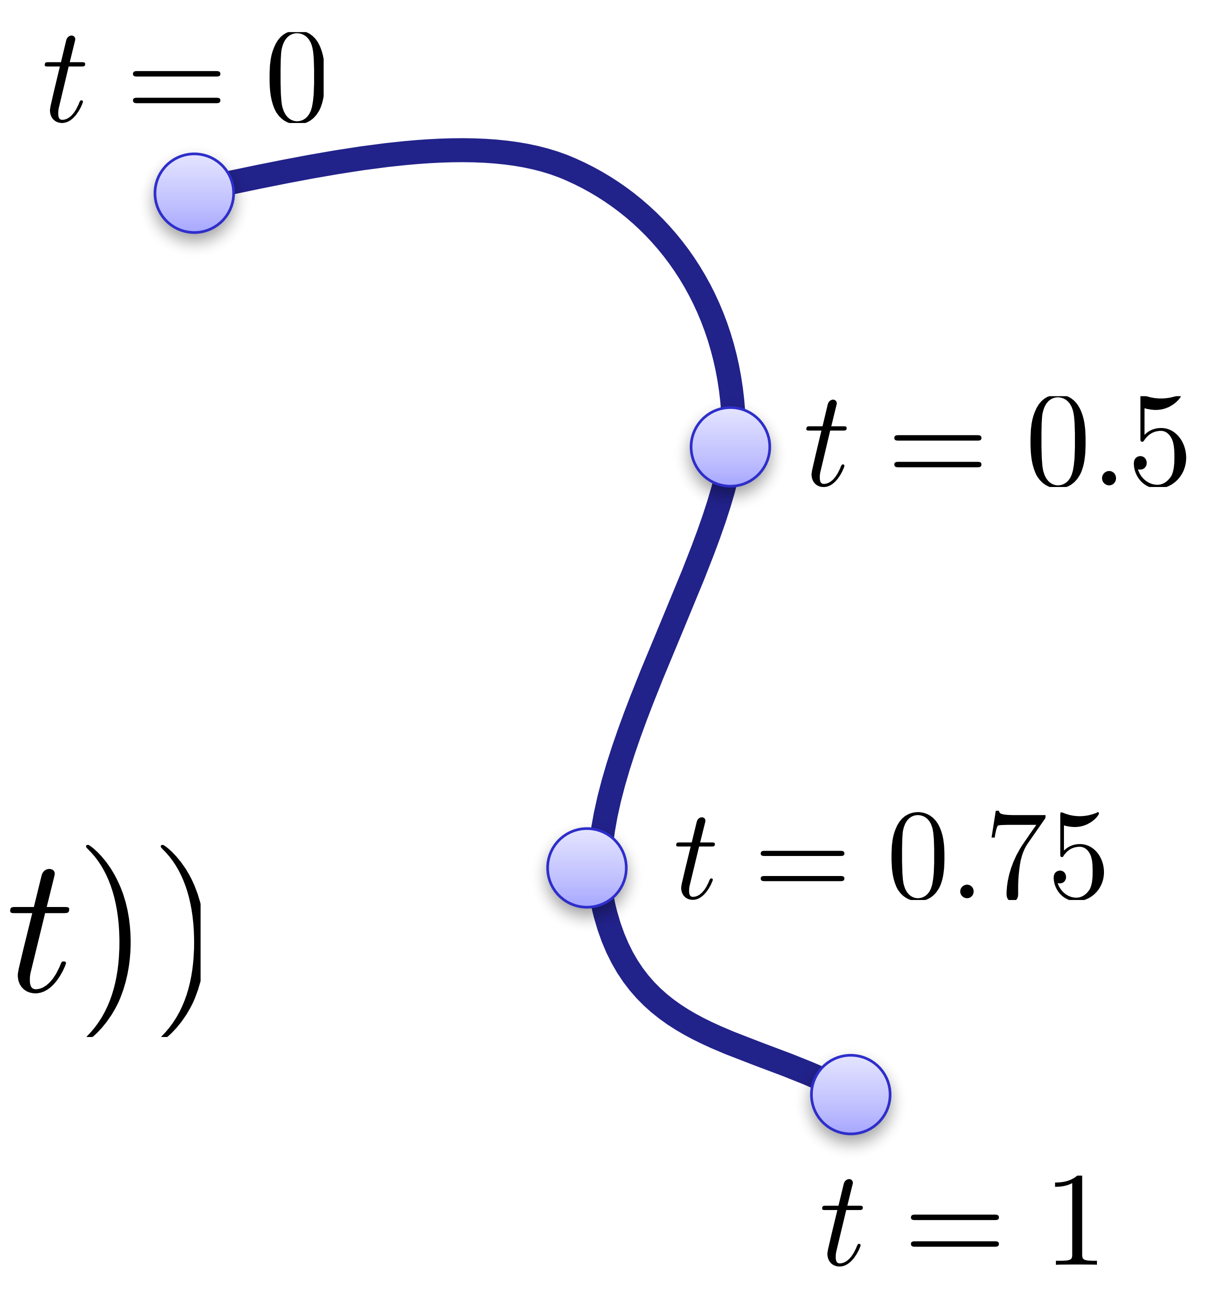
upsampling –
need to count density

- Need sub-linear-time implementations of
  - k-nearest neighbors to point $\mathbf{x}$
  - In-radius search $\|\mathbf{p}_i - \mathbf{x}\| < \varepsilon$

Parametric Curves and Surfaces

Parametric Representation of Curves

- Planar curve: $s(t) = (x(t), y(t))$
- Space curve: $s(t) = (x(t), y(t), z(t))$

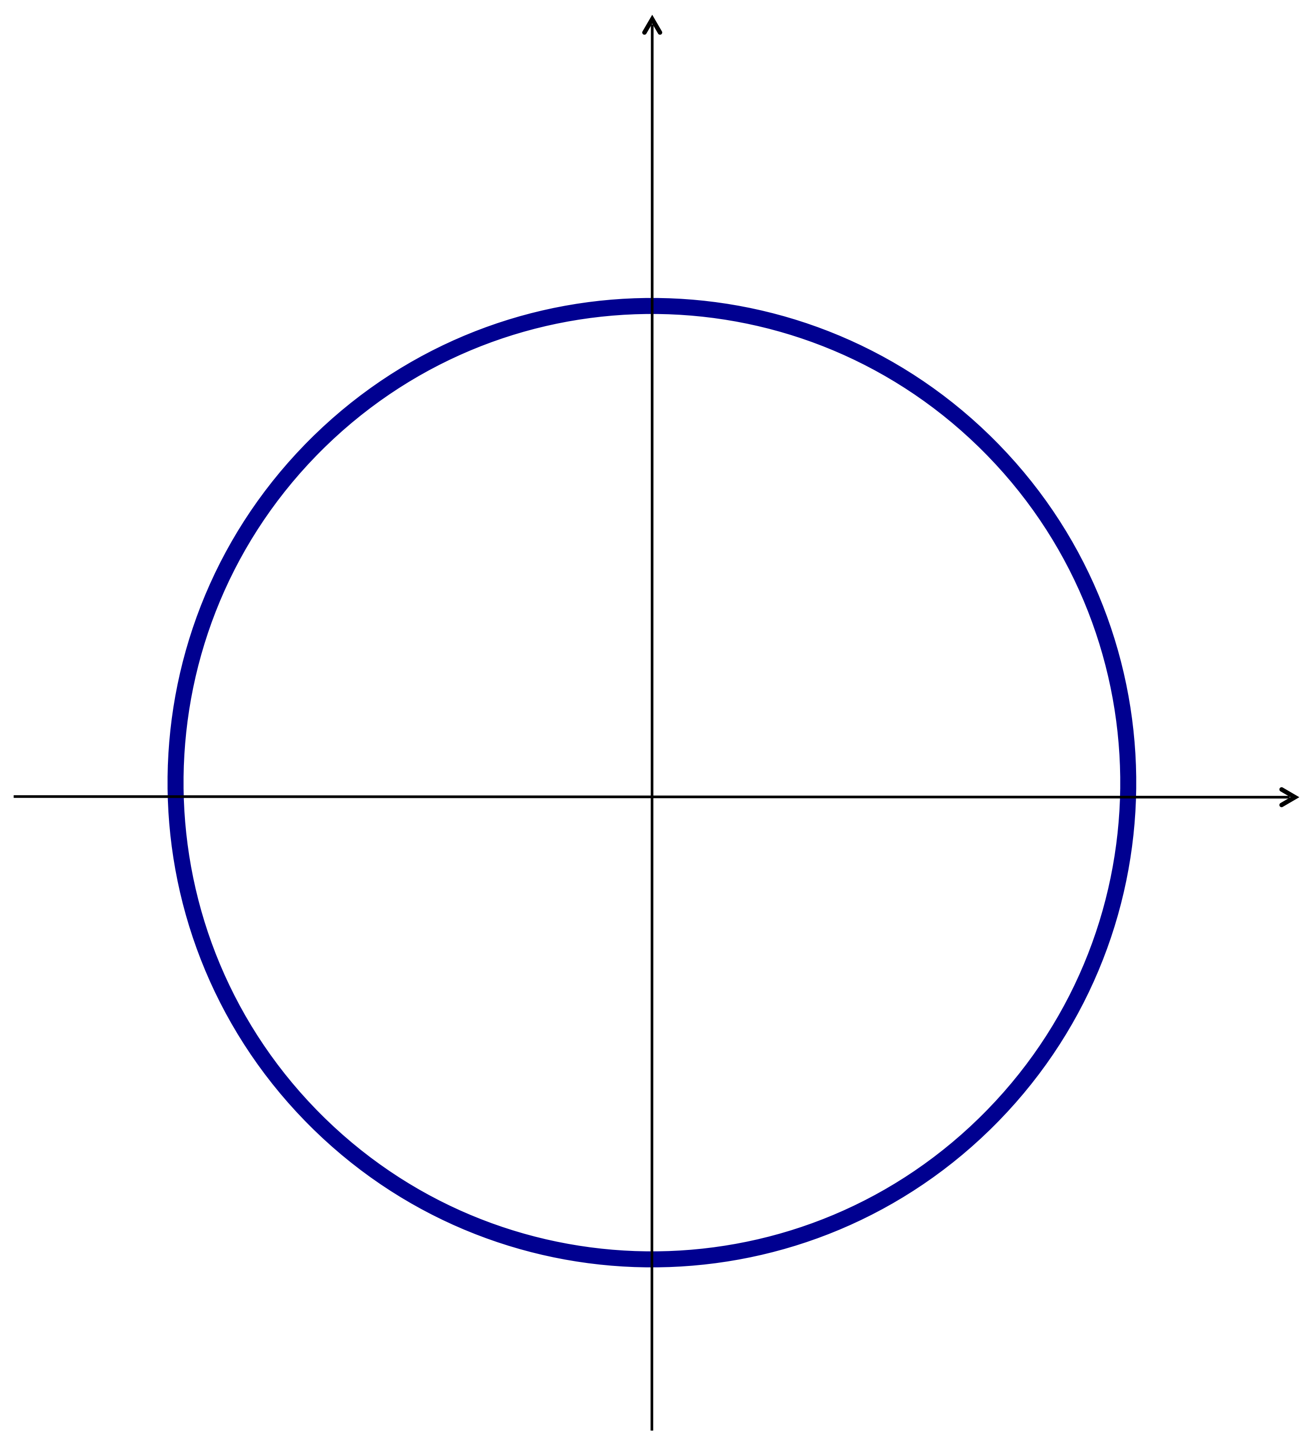


Parametric Curves

- Explicit curve/circle in 2D

$$\mathbf{p}(t) = r\,(\cos(t), \sin(t))$$

$$t \in [0, 2\pi)$$

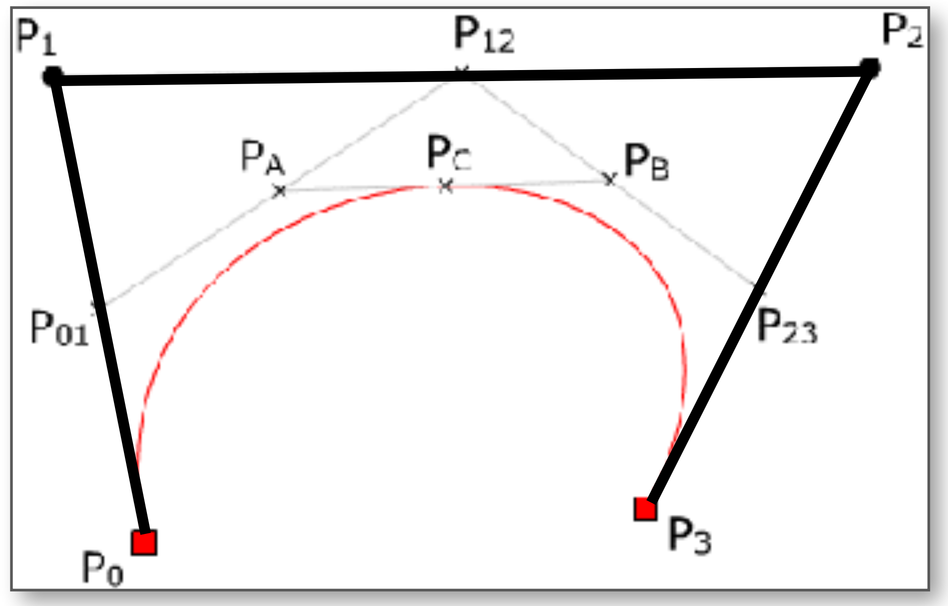


University of Victoria | Computer Science

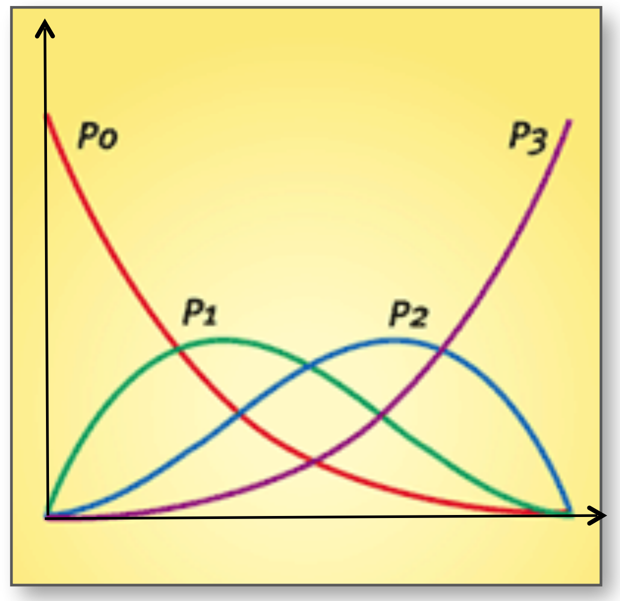
Parametric Curves

- Bezier curves, splines

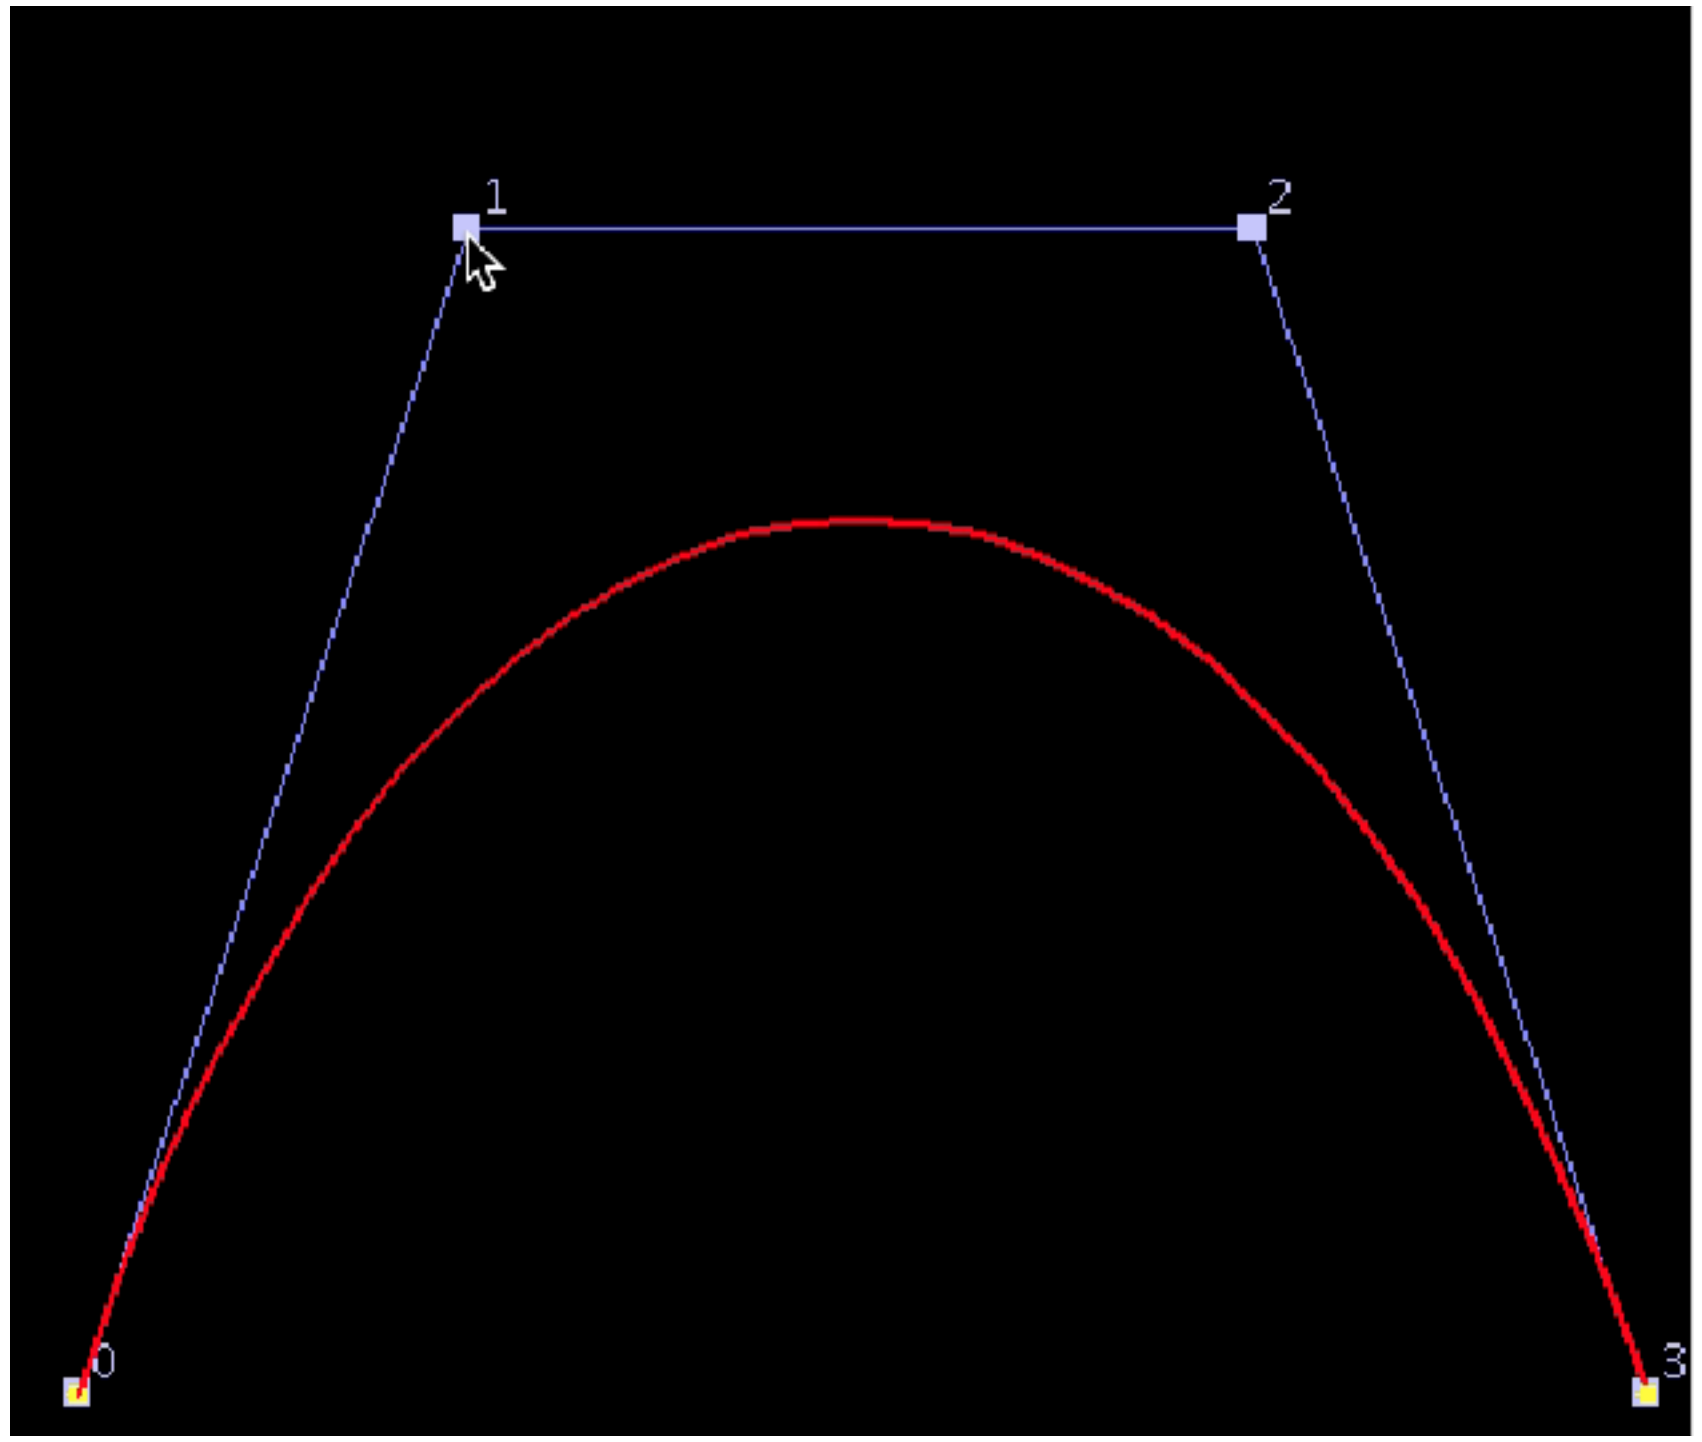
$$s(t) = \sum_{i=0}^{n} \mathbf{p}_i B_i^n(t) \qquad B_i^n(t) = \binom{n}{i} t^i (1-t)^{n-i}$$



Curve and control polygon

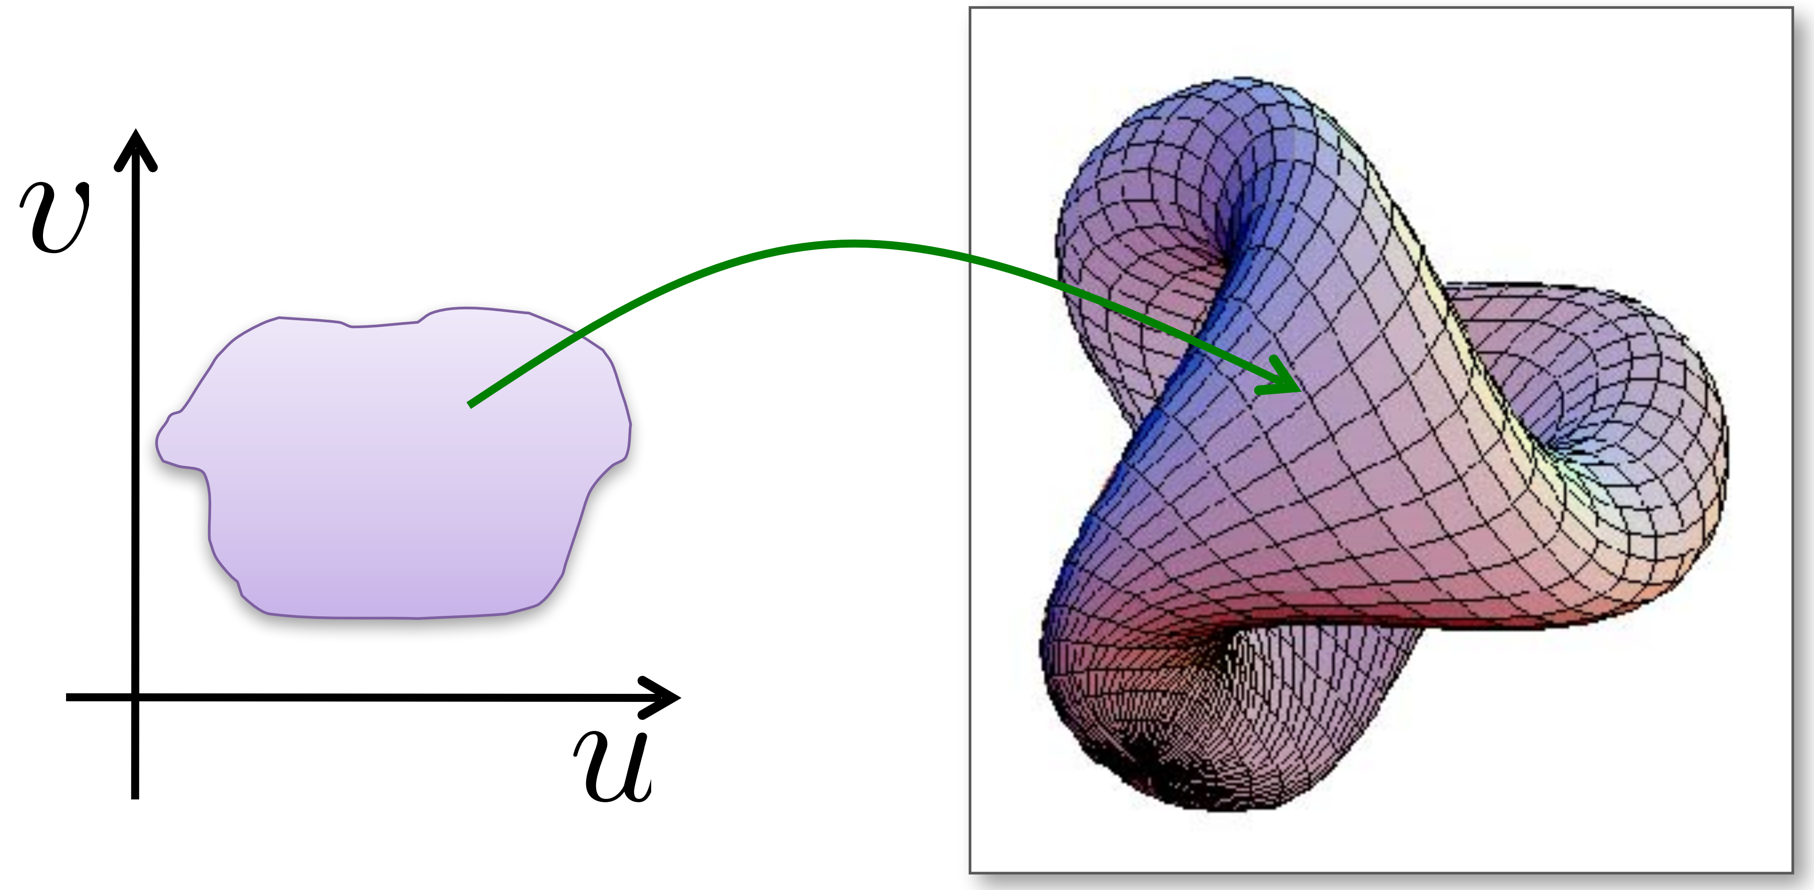


Basis functions



University of Victoria | Computer Science

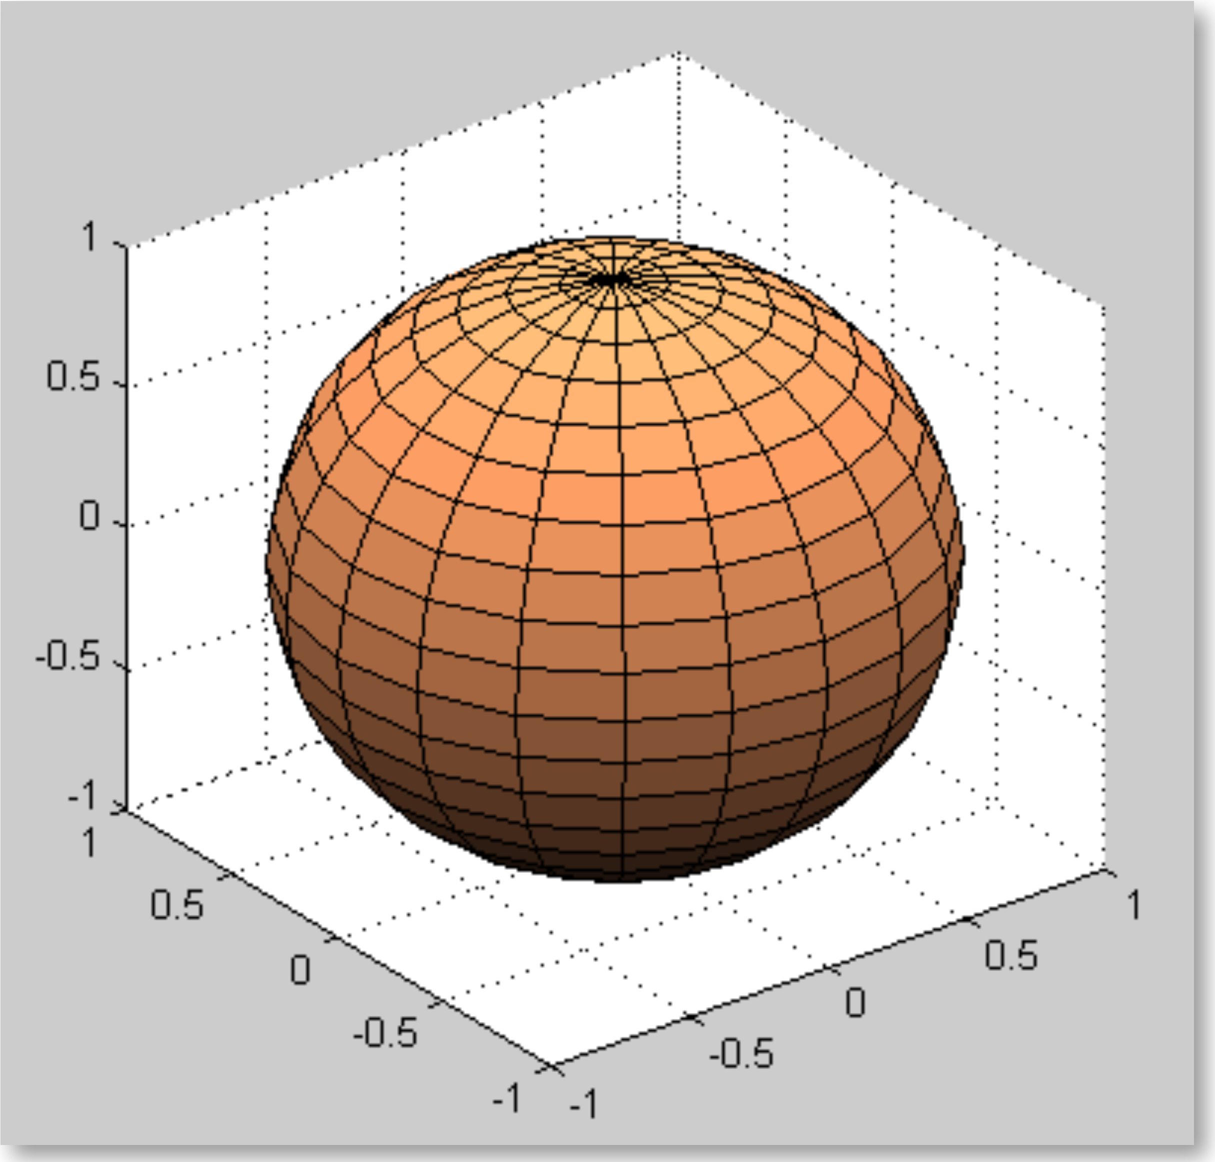
Parametric Representation of Surfaces



$$s(u,v) = (x(u,v), y(u,v), z(u,v))$$

Parametric Surfaces

- Sphere in 3D



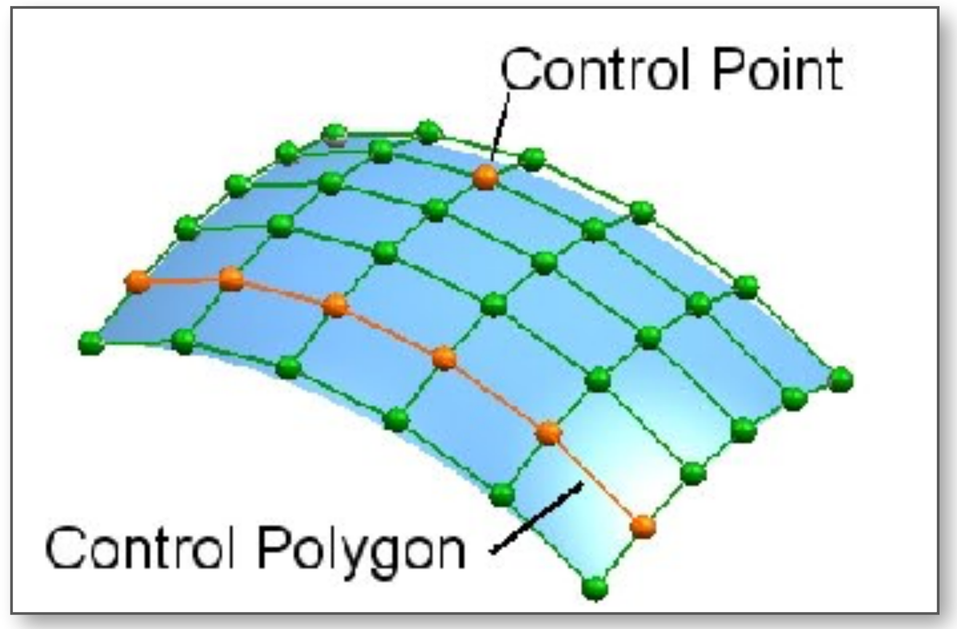
$$s(u,v) = r\left(\cos(u)\cos(v), \sin(u)\cos(v), \sin(v)\right)$$

$$(u,v) \in [0, 2\pi) \times [-\pi/2, \pi/2]$$

Parametric Surfaces

- Bezier surface:

$$s(u,v) = \sum_{i=0}^{m}\sum_{j=0}^{n} \mathbf{p}_{i,j} B_i^m(u) B_j^n(v)$$

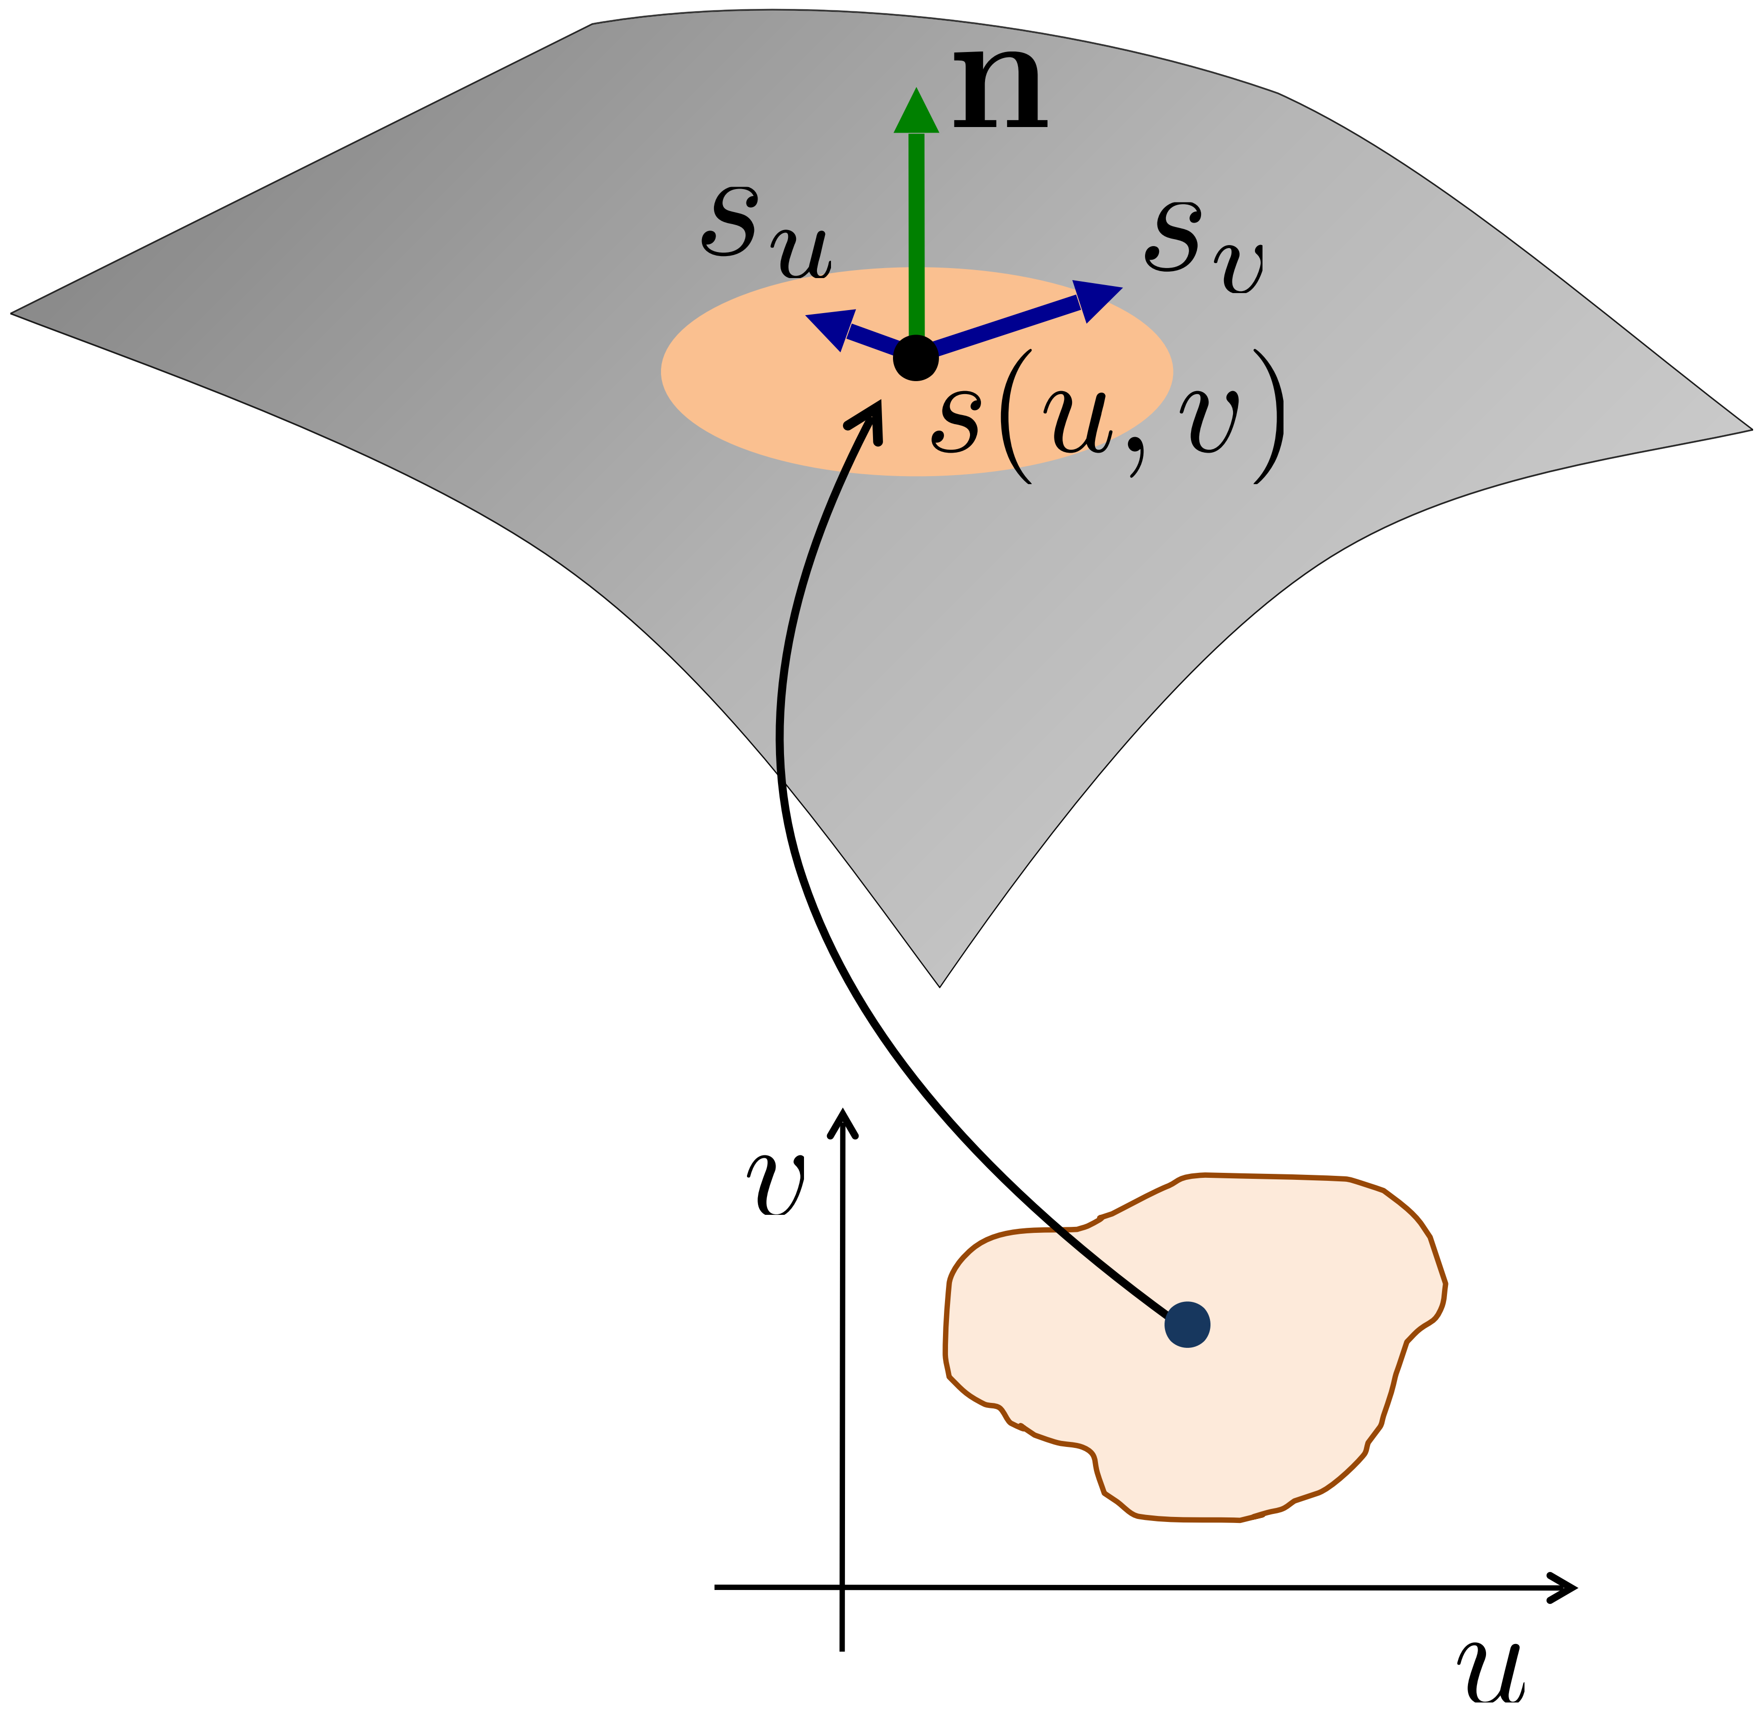


Tangents and Normal

$$s_u = \frac{\partial s(u,v)}{\partial u}$$

$$s_v = \frac{\partial s(u,v)}{\partial v}$$

$$\mathbf{n} = \frac{s_u \times s_v}{\|s_u \times s_v\|}$$



Tangent plane is normal to **n**

Parametric Curves and Surfaces

- Advantages
  - Easy to generate points on the curve/surface
  - Separates x/y/z components
- Disadvantages
  - Hard to determine inside/outside
  - Hard to determine if a point is **on** the curve/surface

Implicit Curves and Surfaces

Implicit Curves and Surfaces

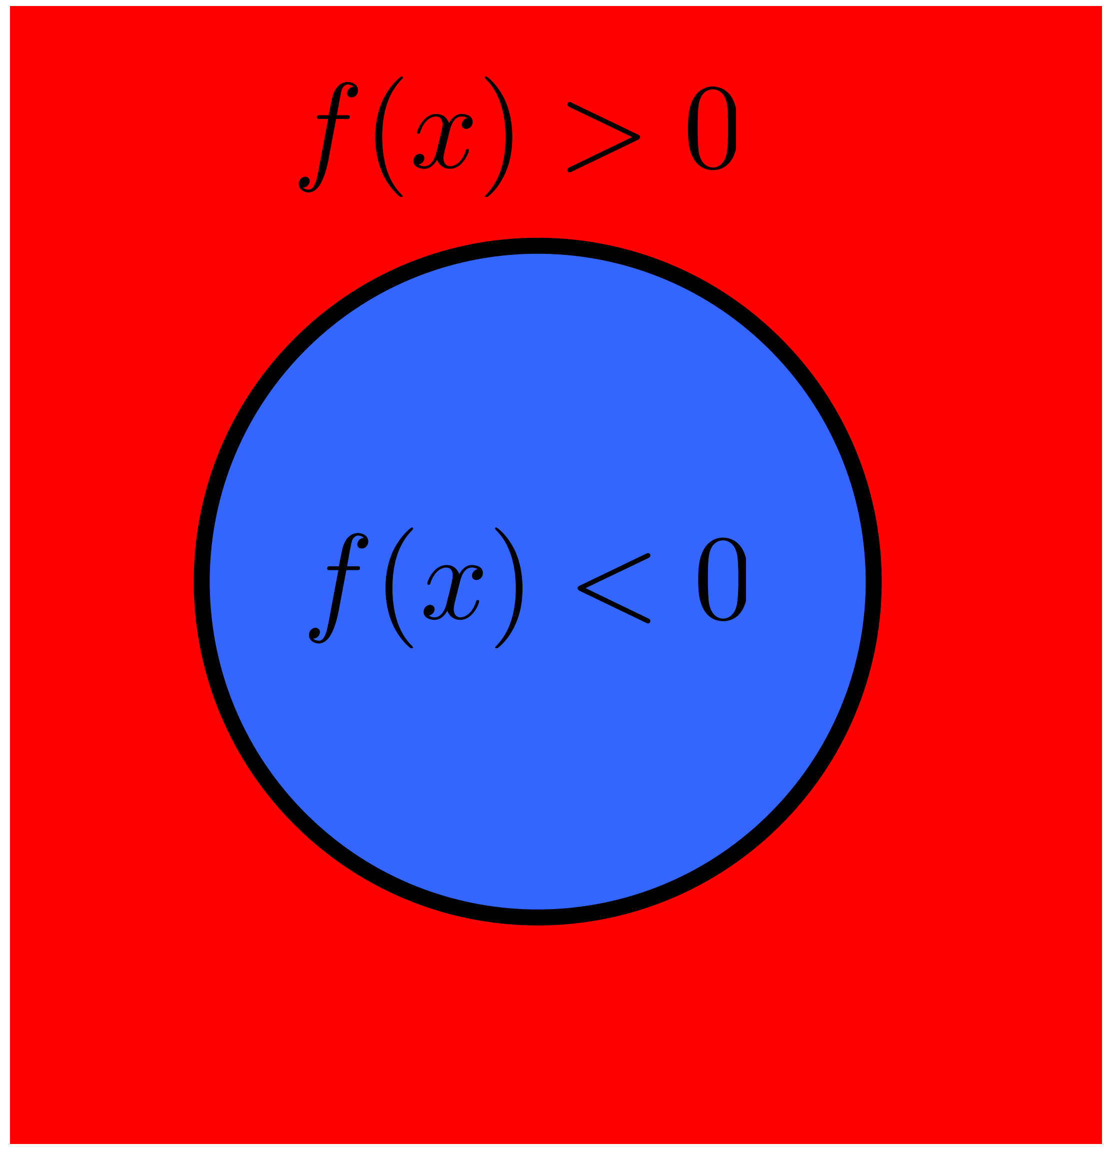
- Kernel of a scalar function
  - Curve in 2D: $S = \{x \in \mathbb{R}^2 | f(x) = 0\}$
  - Surface in 3D: $S = \{x \in \mathbb{R}^3 | f(x) = 0\}$

- Space partitioning

$\{x \in \mathbb{R}^m | f(x) > 0\}$ Outside

$\{x \in \mathbb{R}^m | f(x) = 0\}$ Curve/Surface

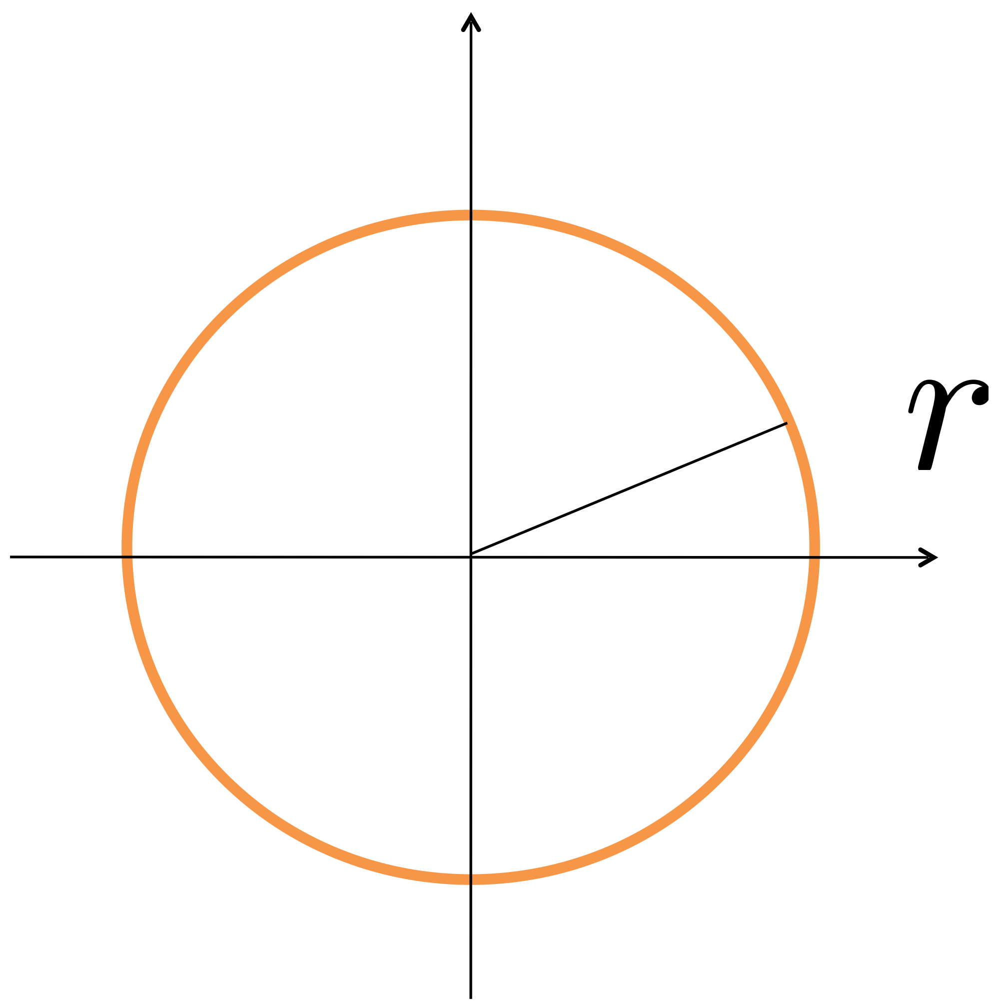
$\{x \in \mathbb{R}^m | f(x) < 0\}$ Inside

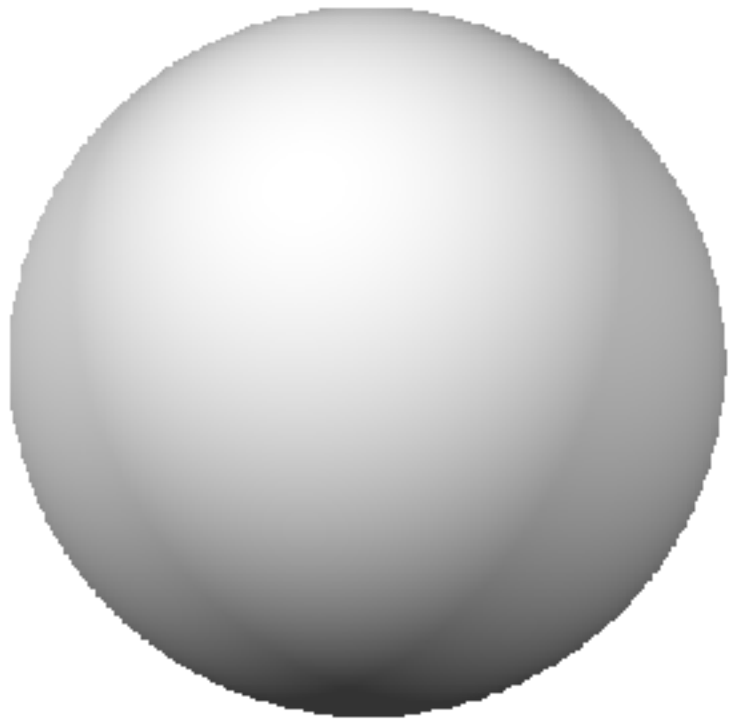


Implicit Curves and Surfaces

- Implicit circle and sphere

$$f(x,y) = x^2 + y^2 - r^2 \qquad f(x,y,z) = x^2 + y^2 + z^2 - r^2$$

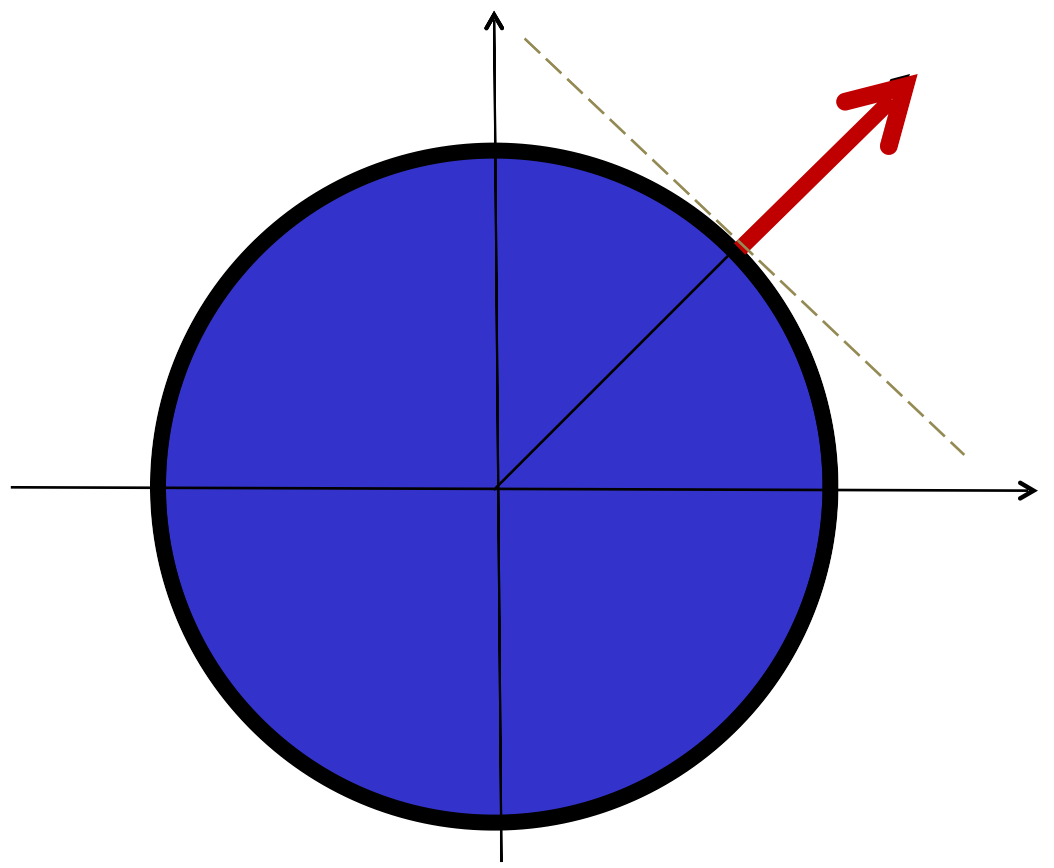




Implicit Curves and Surfaces

- The normal direction to the surface (curve) is given by the gradient of the implicit function

$$\nabla f(x, y, z) = \left(\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}\right)^T$$



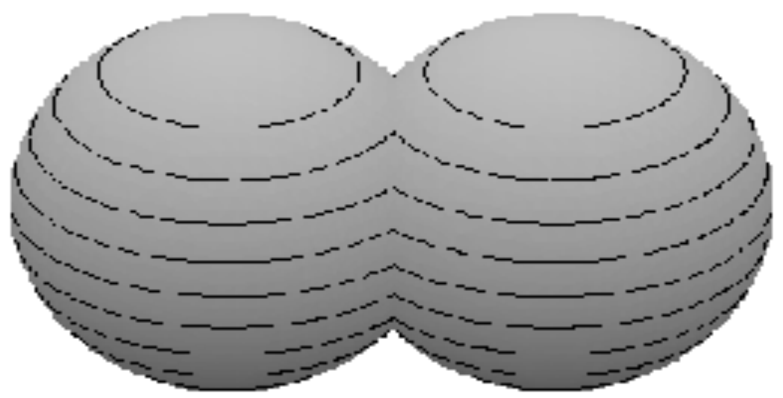
- Example

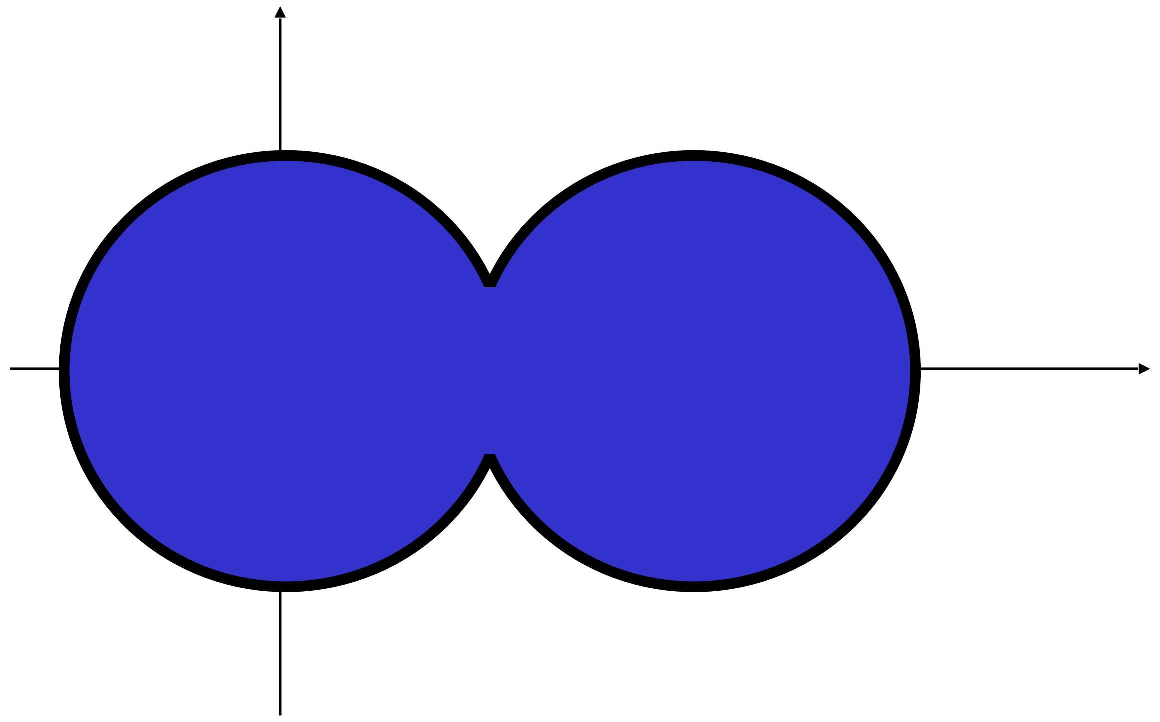
$$f(x, y, z) = x^2 + y^2 + z^2 - r^2$$

$$\nabla f(x, y, z) = (2x, 2y, 2z)^T$$

Boolean Set Operations

- Union: $$\bigcup_i f_i(x) = \min f_i(x)$$



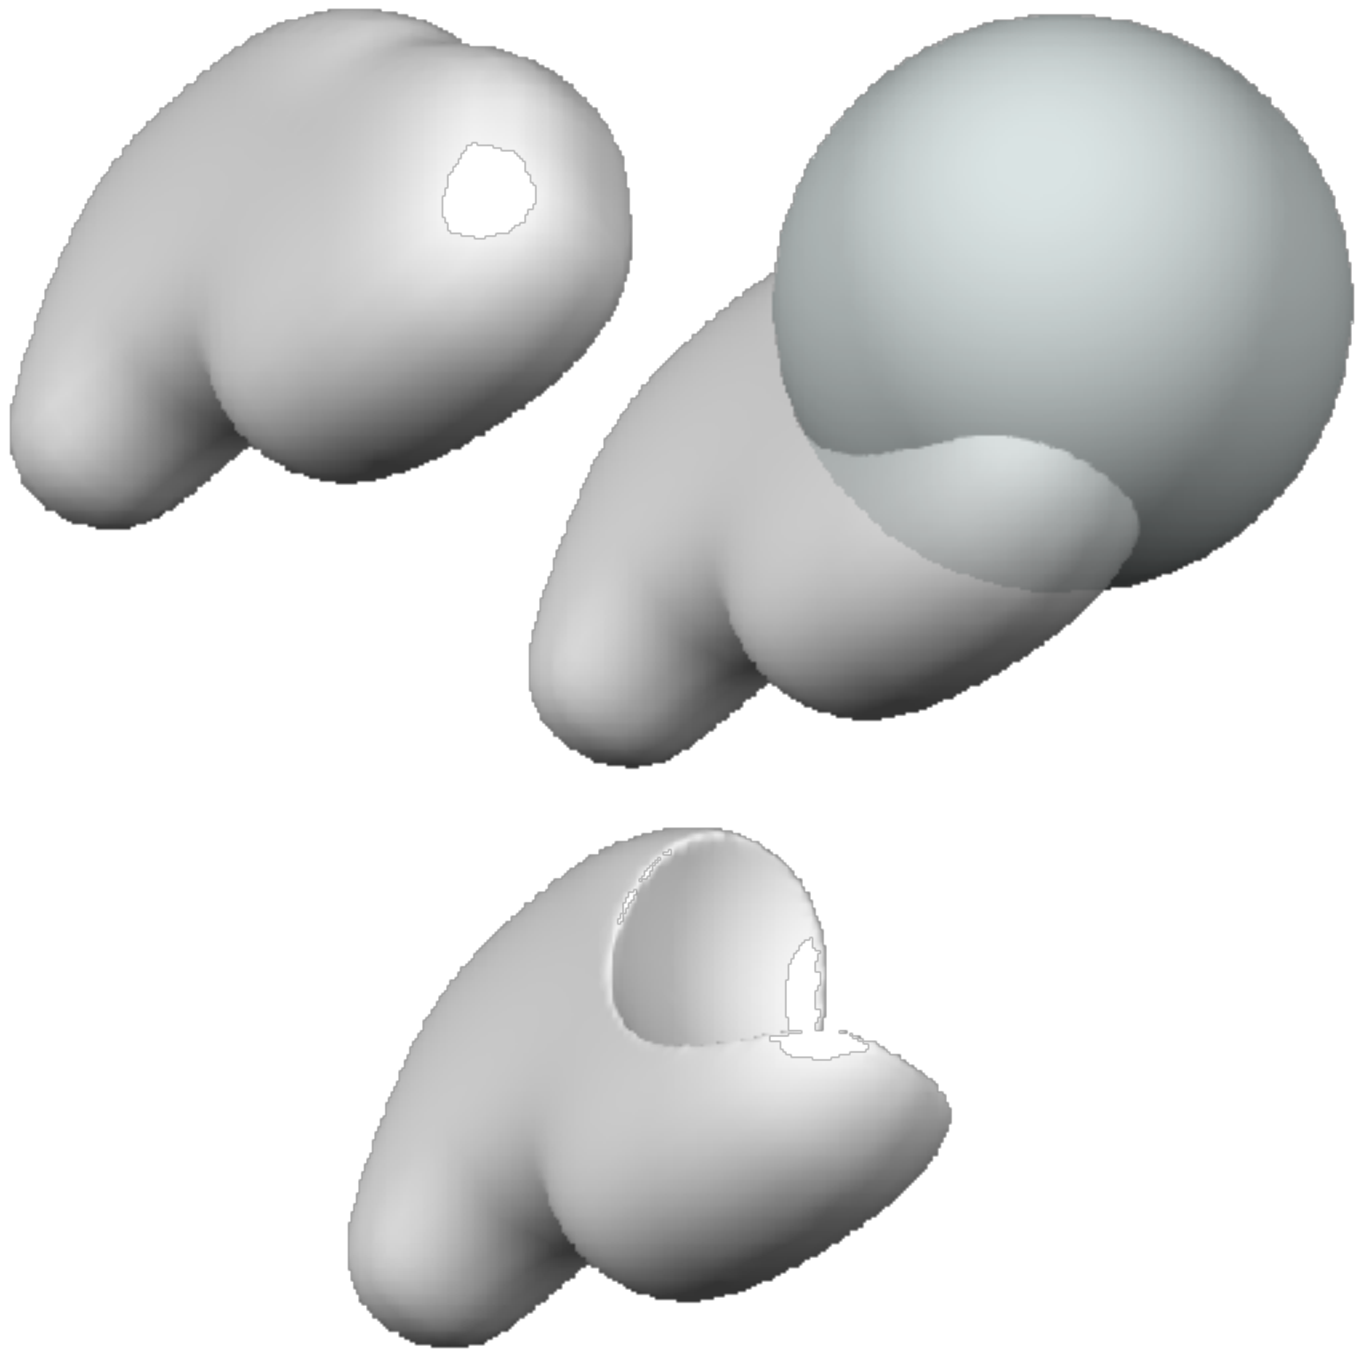


- Intersection: $$\bigcap_i f_i(x) = \max f_i(x)$$

Boolean Set Operations

- Positive = outside, negative = inside
- Boolean subtraction: $h = max(f, -g)$

	$f > 0$	$f < 0$
$g > 0$	$h > 0$	$h < 0$
$g < 0$	$h > 0$	$h > 0$



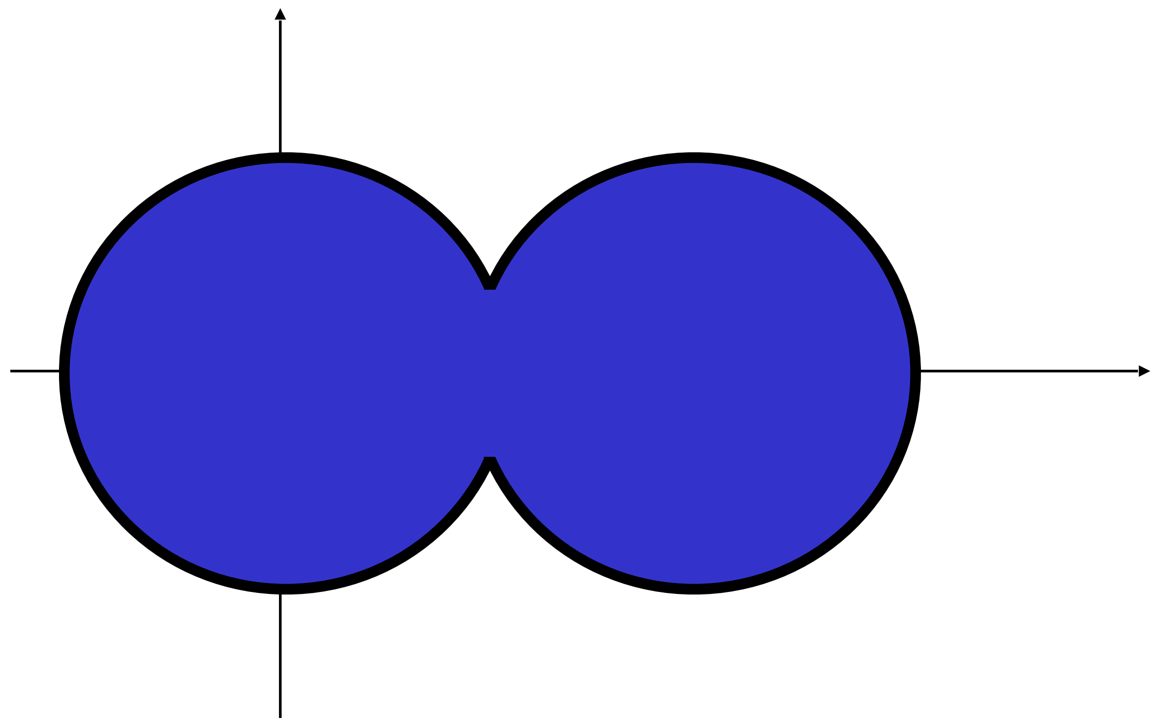
- Much easier than for parametric surfaces!

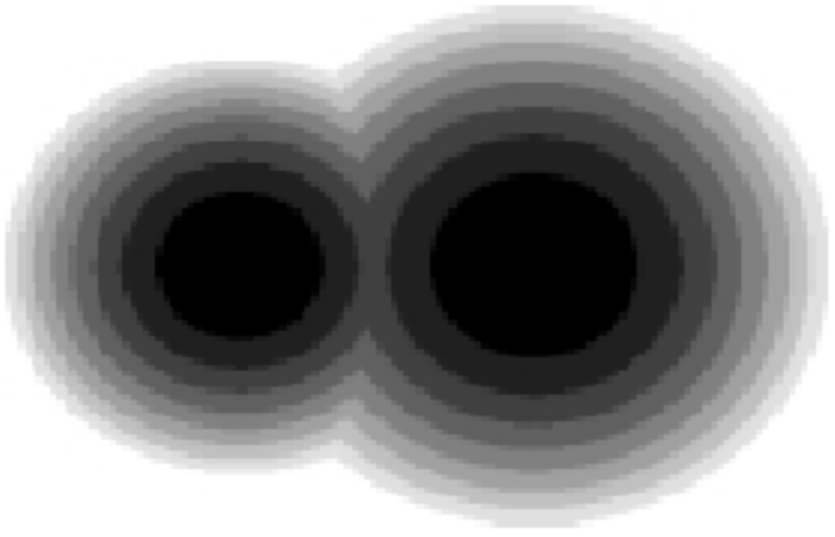
Smooth Set Operations

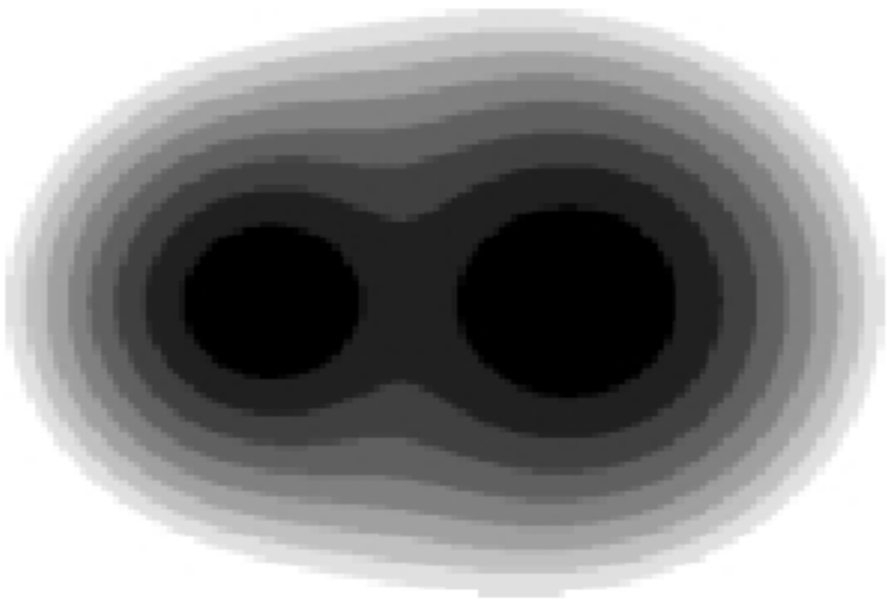
- In many cases, smooth blending is desired
  - Pasko and Savchenko, Blending operations for the functionally based constructive geometry [1994]

$$f \cup g = \frac{1}{1+\alpha}\left(f + g - \sqrt{f^2 + g^2 - 2\alpha f g}\right)$$

$$f \cap g = \frac{1}{1+\alpha}\left(f + g + \sqrt{f^2 + g^2 - 2\alpha f g}\right)$$

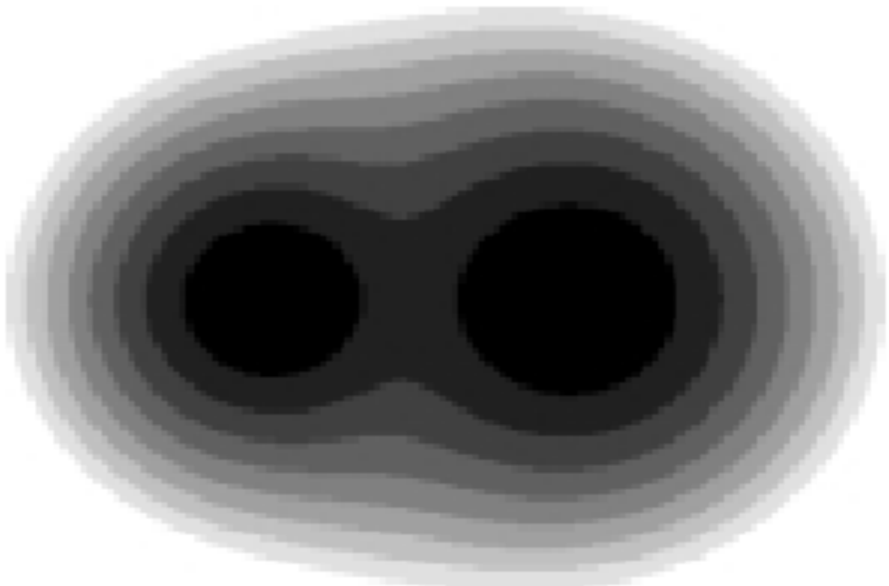




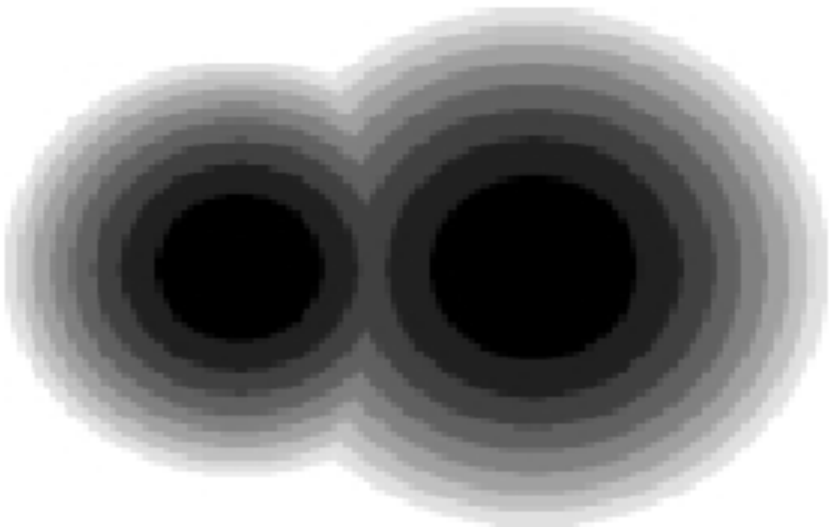


Smooth Set Operations

- Examples



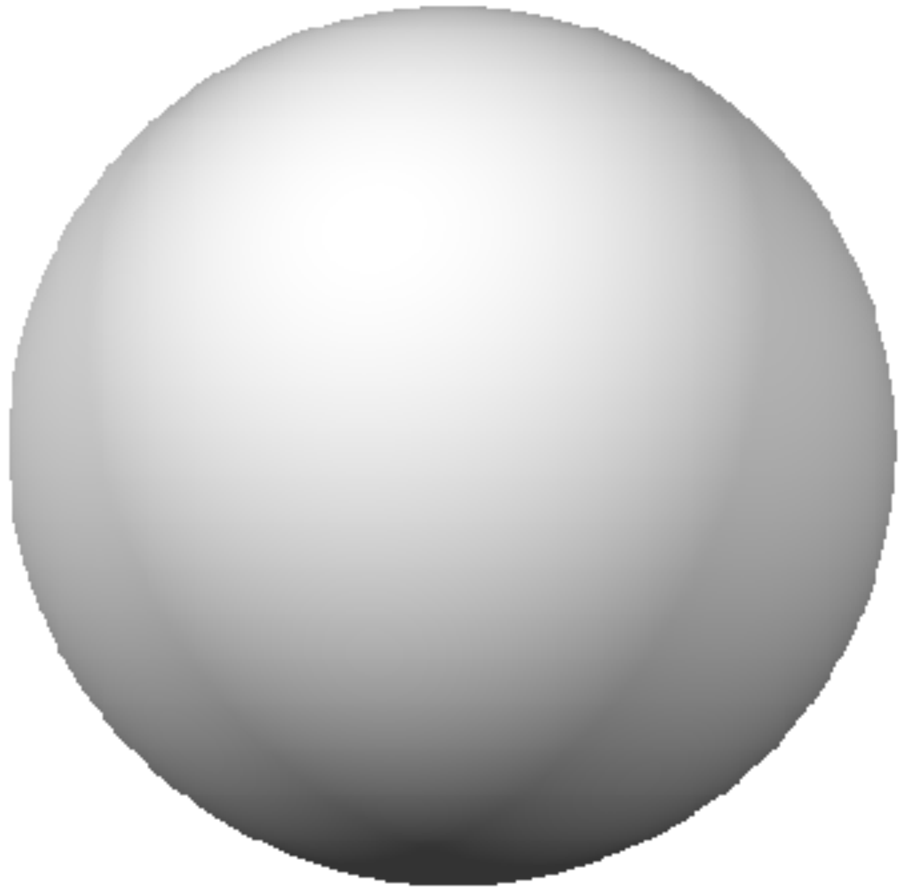
$\alpha = 0$



$\alpha = 1$

Designing with Implicit Surfaces

- Zero set (or level set) of a function:



$$f(\mathbf{p}) = \|\mathbf{p}\|^2 - r^2$$

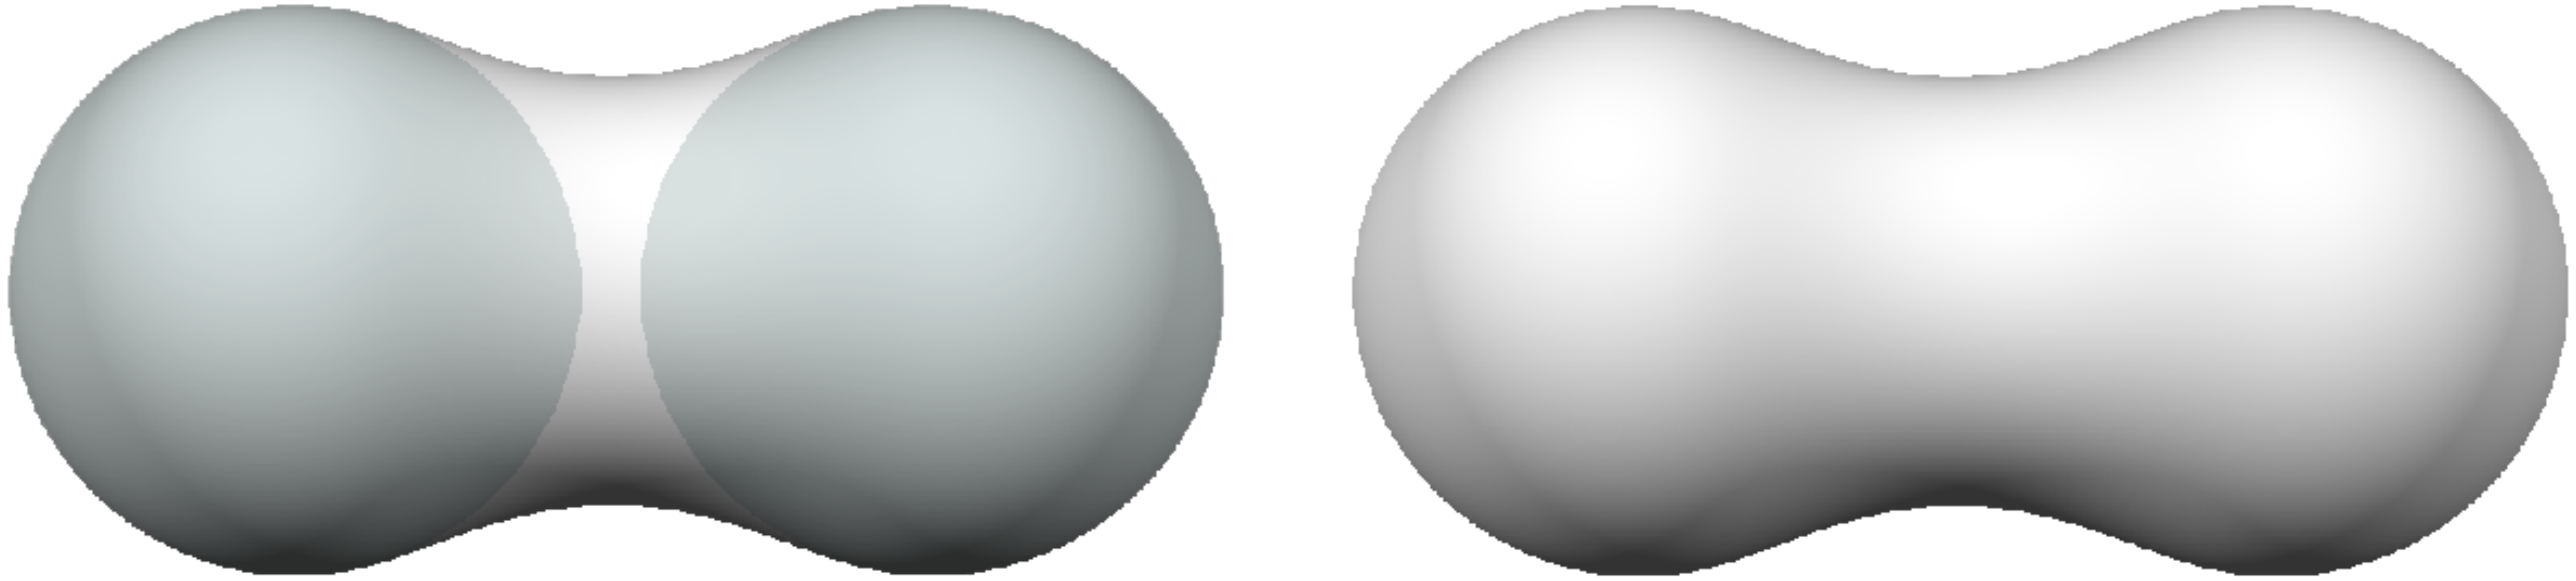
- But also a level set at value e^{-1} of this function:

$$f(\mathbf{p}) = e^{-\|\mathbf{p}\|^2/r^2} \text{ at } e^{-1}$$

Designing with Implicit Surfaces

- With smooth falloff functions, adding implicit functions generates a blend:

$$f(\mathbf{p}) = e^{-\|\mathbf{p}-\mathbf{p}_1\|^2} + e^{-\|\mathbf{p}-\mathbf{p}_2\|^2}$$



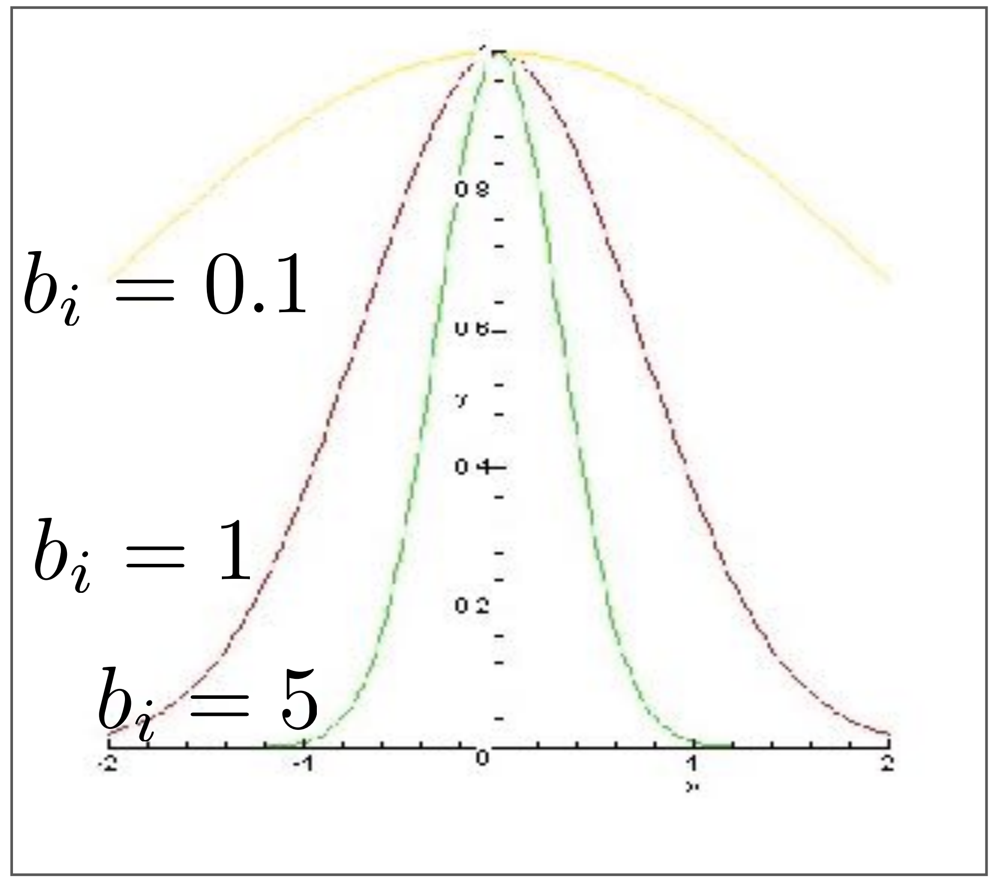
- Called “Metaballs” or “Blobs”

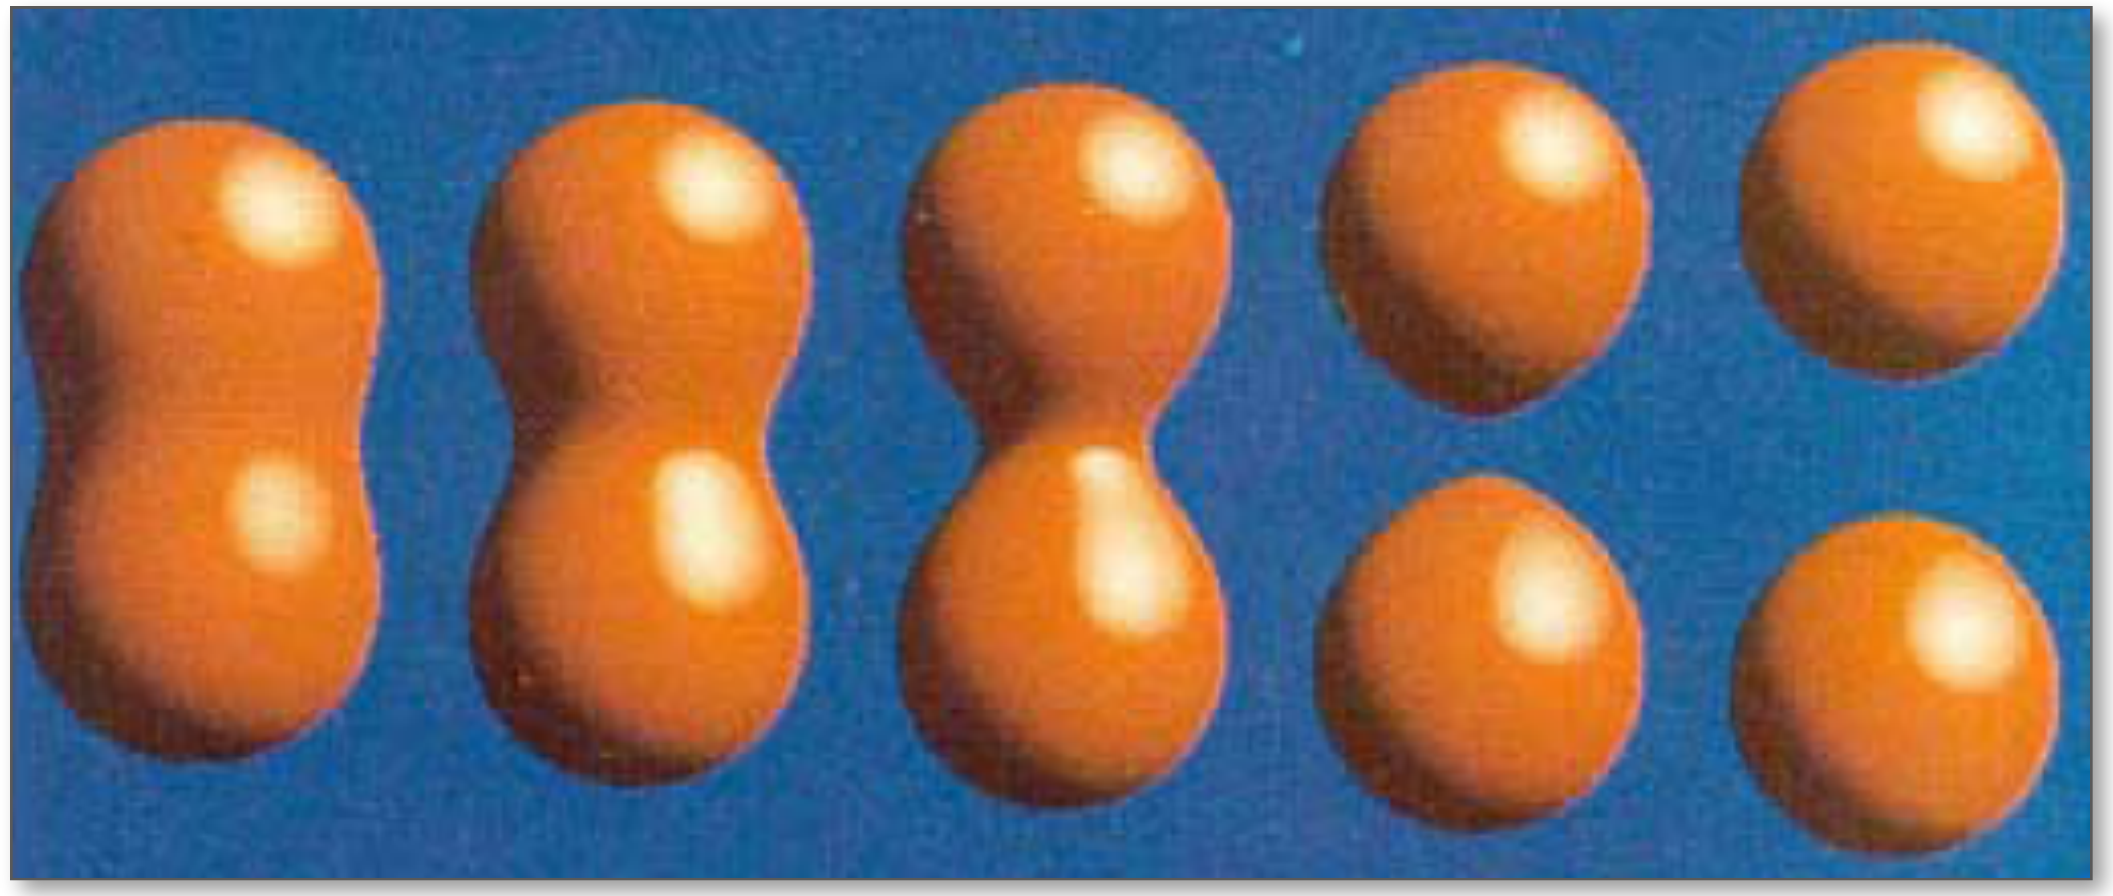
Blobs

- Suggested by Blinn [1982]
  - Defined implicitly by a potential function around a point $\mathbf{p}_i$:

$$f(\mathbf{p}) = a_i e^{-b_i \|\mathbf{p}-\mathbf{p}_i\|^2}$$

  - Set operations by simple addition/subtraction





J. Blinn, "A Generalization of Algebraic Surface Drawing", ACM Transactions on Graphics, Vol. 1, No. 3, pp. 235-256, July, 1982.

Blobs

Implicit Curves and Surfaces

- Advantages
  - Easy to determine inside/outside
  - Easy to determine if a point is **on** the curve/surface
- Disadvantages
  - Hard to generate points on the curve/surface
  - Does not lend itself to (real-time) rendering

Summary

Parametric	Implicit	Discrete/Sampled
		• Splines, tensor-product surfaces • Subdivision surfaces	• Metaballs/blobs • Distance fields	• Meshes • Point set surfaces
